## **Biographical Note:**

Christina Donovan is a Lecturer in the School of Childhood, Youth and Education Studies, Manchester Metropolitan University. She is currently a PhD Candidate at Edge Hill University where her doctoral research focuses on how trust is socially constructed in Further Education settings; a sector where she was a practitioner for several years.

## **Distrust by Design? Conceptualising the role of Trust and Distrust in the development of Further Education Policy and Practice in England**

It would be relatively easy, and with good reason, to assume that social trust is a normatively good value to promote within institutions. Trust encourages cooperation between actors, and thus normalises policies, practices and behaviours that tend to work for the social good of all people, rather than just individuals. To assume all of this would also be to assume that trust should, in aspiration at least, be central to public policy design. However, I argue in this conceptual paper that the competitive landscape of the English Further Education sector in the years since Incorporation does not lend itself to the values of cooperation and social good. The extent to which forced competition has become normalised has made concerns over financial health commonplace around the boardroom in FE Colleges. In this context, perhaps the benefits associated with building and maintaining trust in this context are problematic. Perhaps it is important to consider whether in fact, *distrust* is fundamental to institutional survival? This paper draws upon three key theoretical concepts from the trust literature to conceptualise how the Further Education policy environment could necessitate measures which enlist organisations and individual actors towards objectives which are increasingly linked to competition, centrally devised standards and institutional survival. In this way, I suggest in this paper that strategies of distrust may be of greater use in the design of institutional policy, as the need to establish control encourages self-interested practices which take primacy over cooperation.

**Key words:** trust, distrust, neoliberalism, further education

### **Introduction**

Leading a Further Education Institution is a treacherous activity, fraught with possible dangers and the ongoing battle to survive. In a competitive market place where resources are scarce, therefore, College principals are faced with little choice but to carry out their work with the brute force required to keep going in a sector where playing it safe is not an option. Damien Page (2017) would have us believe this to be the case; and as such he argues that principals are given an undue reputation as ‘managerialist tyrants who plunder the pleasures of professionalism and autonomy from the people’ (ibid: 34). In constructing this argument, he names the conflict implicit in much of the FE research literature: the decline of trust between the leaders and the led. Further, the conceptualisation of a brutal, ‘lion-like’ principal provides us with an alternative understanding of leadership in practice. What if the act of distrusting is based on intention, rather than consequence?

65                   ‘What is often forgotten when people engage in disparaging commentary about  
66 principals<sup>1</sup> is the indomitable power of the external environment...yes, principals  
67 make swingeing cuts to their staffing, and yes, they may impose contractual  
68 changes...and yes they may create teaching environments in which teachers are  
69 continually surveilled and evaluated. But let us remember that these are not voluntary  
70 acts of managerialist despotism... the principal’s sole responsibility is the survival of  
71 their college and the education of their students, if that is threatened it is incumbent  
72 upon them to take whatever action necessary’ (Page 2017: 35-36)

73 The provocation made by Page (2017) here brings notions of trust and distrust into sharp focus. He  
74 makes explicit how uncertainty can shape leadership behaviour; particularly when their institution  
75 faces significant financial insecurity. In doing so, he exposes how an institution’s response to  
76 uncertainty influences perceptions of trust on both sides. Relationships based on trust tend to lead to  
77 harmonised workplaces which promote agency and cooperation. Indeed, management research has  
78 shown that trust is a crucial mediating factor in the smooth running of an organisation; from  
79 industrial relations to perceptions of job security and employee wellbeing (Lewicki, Elgoibar, and  
80 Euwema 2016; Wang, Mather, and Seifert 2018). However, given the increasing precariousness of the  
81 environment in which the Further Education (FE) sector operates, it is worth considering whether the  
82 benefits associated with building and maintaining trust in this context are problematic. For example,  
83 agency can lead to risk-taking that could fail to meet the expectations of external auditors (ie, Ofsted).  
84 Similarly, policies predicated upon high trust (such as full-time permanent employment) are  
85 inefficient compared with casual labour, which allows institutions the flexibility to cope with the ebb  
86 and flow of an uncertain funding and policy environment. Perhaps it is important to consider whether,  
87 in fact, *distrust* is fundamental to institutional survival?

88 In this paper, I will draw upon three theoretical concepts provided by the trust research literature to  
89 illustrate how concepts of trust and distrust can be understood from both a policy and organisational  
90 perspective. I will explore how the global trend towards economic advancement necessitates measures  
91 to position education and ‘skills’ as the solution to these problems; thus, actively shaping behaviour  
92 towards these objectives. In the act of problematizing our commonly perceived understanding of trust  
93 in this context, I will demonstrate how on a policy level, forms of low trust and distrust can be utilised  
94 to exert control over institutional and individual practice, but also how distrust can be reciprocated to  
95 *resist control* by those individuals who are subject to such power. In doing so, I will consider whether  
96 English Further Education policy is designed to create distrust, and if so, to what effect. It is important  
97 to note that instead of making claims of absolute truth, I intend that this paper will provoke debate.  
98 The purpose of this article is to stimulate thinking around the role of trust and distrust in educational

---

<sup>1</sup> A principal is often also referred to as the Chief Executive Officer (CEO)

99 leadership and governance, particularly in the context of economic austerity, and global  
100 competitiveness. If the sole job of a principal is indeed to ensure the survival of their college, then this  
101 exercise frames the lack of choice inherent within this context to explore how distrust effectively  
102 limits the capacity for choice; distrust grows where agency is limited.

103 Page's (2017) chapter, *In Defence of the Principal* (see Daley, Orr, and Petrie 2017) is a provocative  
104 piece which is narrated from the perspective of a college principal, justifying the (often distrusting)  
105 behaviour that is perceived by staff from leadership. Whilst the chapter presents in many ways as a  
106 blunt instrument with which to point out the strategic and managerial failures of FE leadership, it at  
107 the same time creates a legitimate line of intellectual inquiry which this paper intends to explore. In  
108 doing so, it will posit that distrust fuels the increased and ongoing instability across the FE sector;  
109 created by a neoliberal policy environment which favours competition rather than cooperation. This  
110 competitive environment, coupled with political and financial uncertainty, steers the practice of  
111 college governance towards managing the huge risks, most of which are financial, associated with  
112 failing to 'get it right'. Although this threat is very real, in part due to the ever-increasing scrutiny and  
113 'intervention' by the FE Commissioner (Hill, James, and Forrest 2016; J Burke 2018), the changing  
114 shape of governance in recent years has nevertheless been to the perceived detriment of those who are  
115 working at the 'chalk-face' (Hill 2000; Gleeson, Abbott, and Hill 2011); a shift that has been  
116 described as a move from trust to 'mistrust' by Thompson and Wolstencroft (2018). They argue that  
117 FE leaders have little say in the direction of their organisations due to heavy-handed political  
118 influence over vocational education strategy.

119 The subject of this paper is timely, given the insolvency regime set to come into force in 2019; further  
120 increasing the burden of risk which will be imposed upon college corporation governing bodies.  
121 Although to date the number interventions by the FE Commissioner for financial concerns have been  
122 limited, the Department for Education have expressed their belief that this is set to increase three-fold  
123 in the wake of the insolvency regime (DfE 2018). Its forthcoming implementation has been attributed  
124 to the recent wave of resignations by prominent college leaders in anticipation of blame for  
125 mismanagement of funding (Burke 2018). Further, the explicit link between Ofsted grading and  
126 financial health reinforces the responsibilisation of leadership in conforming to central objectives,  
127 and limits opportunities for delegation of authority to staff within Colleges.

128 Instability and forced competition for the market-share of students has proved corrosive to building  
129 trust relationships amongst staff within Further Education Colleges (FECs). For example, research by  
130 Coffield et al. (2007) focuses on the lack of participation in the creation of policy design, whilst  
131 O'Leary's (2015) research on graded teaching observation illustrates how instrumentalised pedagogy  
132 is to the detriment of teacher creativity and autonomy. Further, Boocock's (2015; 2017) work on FE  
133 governance highlights the prevalence of leadership models which promote agent self-interest, and

Avis' (2003) study on professional trust relations reflects how this combination of elements reinforces the performative nature of the institutional environment; leading to the construction of trust relationships which are conditional and based on the achievement of strategic objectives. This constitutes a weak and conditional form of trust which is intended to incentivise self-interested and individualist behaviour, known as transactional trust (Uslaner 2002).

One of the issues that Andrew Boocock (2017) highlights is the use of Principal-Agent modes of governance in FE. The so-called P-A model assumes that individual 'agents' (ie, managers and lecturers) are self-interested and require incentives to meet governmental targets and thus conform to demands made of the 'principal'. This model encourages staff within FECs to engage in gaming behaviours to secure funding. Not only does this undermine intrinsic motivations, but privileges conformity at the expense of staff agency and local decision-making. Guido Möllering (2006) further criticises the P-A model as it assumes trust to be a one-directional process, and does not account sufficiently for how the 'agent' (or trustee) is likely to respond, or indeed, how likely they are to reciprocate trust based on the incentives provided.

'An effective policy of localism will require a significant shift away from the current low-trust principal-agent solutions manifest in funding and monitoring systems, driven by marketization, managerialism, 'targets and terror' (Boocock 2017: 308)

Instrumentalisation of self-assessment and rigidity of Ofsted grading criteria indicates the level of conformity required to achieve security, which Boocock (2013) argues is to the expense of meaningful critical reflection in pursuit of favourable Ofsted grades.

### **Problemetizing Notions of Trust and Distrust**

There is a consensus amongst trust researchers that the capacity to trust hangs upon a few key concepts including: *competence, benevolence, integrity and reciprocity* (Skinner, Dietz, and Weibel 2014; Lyon, Möllering, and Saunders 2016). The decision to accept such vulnerability is based on an assessment of whether the other potential 'trustee' has the ability to be trusted (competence), whether they have the 'trustor's' best interests at heart (benevolence) and whether they are honest about their intentions (integrity) (see Lewicki and Brinsfield 2016). These are qualities which are shaped strongly by perception, and whether the act of trusting another will be reciprocated (Sztompka 2008). The act of trusting therefore constitutes a 'leap of faith' on the part of the 'trustor' that the 'trustee' will not betray them (Möllering 2006). Therefore, conflicts in vision and purpose could lead individuals to question the best interests of other parties.

In the FE sector, the question of vision and purpose is a fraught debate. Such debate sits within an ideological landscape encompassing a broad range of stakeholders internally (students, lecturers, leadership teams) and externally (employers, funding bodies, trade unions, membership organisations,

local and national government). Each party is motivated by different intrinsic and extrinsic factors, which are often at odds with the wants and needs of the other players in the environment. This has created fertile ground for fractious, low-trust relationships to emerge between those that create policy, those that implement policy, and those that are the subject to such policy.

The business principles of efficiency and educational principles of inclusion and social justice play out in an environment of conflicting interests; leading to a cycle of binary thinking in which those who implement policy (leadership) and those subject to policy (staff) have often found themselves either side of the ideological divide. This in effect precludes the possibility of either party taking the ‘leap of faith’ required to trust. The next section of this paper will use the theoretical literature on trust to explore how the evolution of policy has contributed to the creation of a low trust environment within FE organisations.

### ***The Evolution of Distrust in FE Policy***

Since 1992, the English Further Education system has been subject to sustained cuts in government funding (IFS 2018), as well as systematic deregulation; forcing Further Education Colleges (FECs) to operate within a ‘quasi-market’ competing with other FECs for funded student places, and thus, financial stability. The previous Liberal-Democrat-Conservative Coalition Government (2010-2015) and the current Conservative Government’s austerity strategies have been particularly aggressive, and there have been no signs of the Government slowing down its approach to this already impoverished sector since. As such, cuts to courses, departments and redundancy have become an everyday feature of working within the Further Education environment (O’Leary and Rami 2017).

Successive governments have become increasingly instrumentalist in their approach to FE policy. Provision which had largely been provided locally by Local Education Authorities (LEAs) and voluntary groups became increasingly rationalised and audited. The *1992 Further and Higher Education Act* was the tipping point in the evolution of instrumentalism, audit and free market competition. The removal of the sector from LEA control forced Further Education Colleges (FECs) to compete with other colleges for funding in a competitive ‘quasi-market’, which was centrally administered through the newly-established Further Education Funding Council (FEFC)<sup>2</sup>. The council imposed strict conditions for funding (Bailey and Unwin 2014) and its function served to extend accountability into central government (Lucas and Crowther 2016). The increased autonomy afforded to institutions allowed the government to disassociate from the practices of individual organisations. Although it has been argued by Lucas and Crowther (2016: 587) that the need for change in the FE sector was justified, it was the ‘dominant political belief by government at the time in a competitive

---

<sup>2</sup> Since 1992, further education funding bodies have gone under several iterations, which is currently the Education and Skills Funding Agency (ESFA)

market that formed the basis of incorporation'. It is therefore the long-term impact of this ideological position, rather than the need for change itself, which has rippled through the sector since.

The drive towards competition was guided by the neoliberal principle that the freedom afforded by de-regulation would permit opportunities to test, try and fail on the assumption that high quality service would be guided by the free market. Given the perceived lack of importance of the further education and skills sector, FE was ripe for this kind of experimentation (Keep 2006). Providers were forced to compete with neighbouring institutions, which brought with it an aggressive form of individualism (Finlay and Finnie 2002; Ball 2005). The upshot of the forced competition imposed by the Act led to budgetary deficits within FECs, which diverted attention away from pedagogical matters to excessive administration (Keep 2006). Job losses, the casualization of employment, and reductions in conditions of service and pay led to substantial industrial unrest (Williams 2003), which has seen a recent resurgence as the impact of austerity bites harder than ever in colleges across England (O'Leary and Rami 2017).

In the thirty years since Incorporation, the sector has faced some of the most dramatic and rapid policy change globally (Keep 2015), serving to keep the FECs along with their many and various stakeholders in a constant state of flux. This chaotic environment has resulted in a decline in collective identity and shared values base which would allow those who work in FE to have a common understanding of its role and purpose in society (Lucas and Crowther 2016; Duckworth and Smith 2018). The 'local knowledge' of educators became de-valued by managers due to a centralised preoccupation with meeting targets (Smith and O'Leary 2013); exposing the conflicting interests between policymakers, the implementers of policy and the subject of policy. The *All Change* report produced by the Institute for Government (2017) attributed policy churn to a conflict in perceived purpose of FE and the high levels of discretion ministers have in making changes to the system.

The fundamental difference in value-orientation amongst the actors at play continue to increase the distance between those who lead and govern FE institutions, and those who learn and work within them (Boocock 2011). These insecure work environments heightened anxieties and insecurities amongst staff members and reduced professional autonomy and trust in the employer-employee relationship (Williams 2003).

Presently, the strain upon these professional relationships is tightening as disputes over pay get louder (Burke 2018), and ever-more lecturers consider leaving the profession (Jones 2015). A recent workforce survey by the Association of Colleges reported an overall 17.8% sector staff turnover rate for the year 2016/17. Whilst 42% of management staff and 48% of teaching staff did not report a reason for resignation, staff at 80% of Colleges reported stress and mental ill health as a main reason for sickness absence. Further, 61% of Colleges reported compulsory redundancies (AoC 2017). The report suggests makes explicit the fragile environments in which staff in FE are working, contributing

to the strain created by high stakes policy.

A study of note by Wang, Mather, and Seifert (2018) into job insecurity in the UK (in particular post-2008 financial crisis) found that collective trust in management was a key mediating factor in softening feelings of job insecurity and anxiety during times of uncertainty. In particular, the study posited that the notion of ‘hidden job insecurity’ (characterised by the loss of ‘valued job features’ such as pay or responsibility) played an important role in feelings of commitment towards an organisation. Within the FE context, it is possible to argue that professionalism and autonomy are abstract ‘valued job features’ which have been lost (Thompson and Wolstencroft 2018), and are currently mitigating against institutional commitment and loyalty in the retention of educators in FE, leaving the ‘job survivors’ to do more with fewer resources (ibid).

### ***Social Traps and Institutional Trust***

The ongoing conflict between unions and policy-makers exposes the breakdown of trust between employees, institutions and government. Bo Rothstein’s (2005; 2013) notion of the ‘Social Trap’, illustrated in *Figure 1*, helps us to understand how the policy churn and its subsequent implementation in FECs can be understood. A ‘social trap’ is a process whereby distrust is perpetuated on the basis that all other actors also believe that others will choose to distrust. According to Rothstein (2013:1021) ‘people have no choice but to make judgements based on the imperfect information that is available to them’. This ‘imperfect’ information informs perceptions, and thus can influence the behaviour of individuals towards each other. Therefore, perception becomes a force which perpetuates a ‘trap’ of weak trust.

*[Insert Figure 1 here: The Social Trap: Policy, Practice and Distrust in FE (adapted from Rothstein 2005)]*

*Figure 1*, therefore, allows us to understand how the perpetual reinforcement of high risk and low trust relates to Ewart Keep’s (2006: 52) assertion that constant government intervention in the FE context has led to policy stagnation, in which the power of the state is reproduced and reinforced by political short-termism.

‘a cycle of state intervention [forces central government] to intervene further in order to shore up earlier interventions, targets and policy goals; and this process in turn is driving a continuous reproduction and strengthening of state power within the Education and Training system’ (Keep, 2006: 52)

Keep (2006) further argues that the state secures its control over the market by using various agencies as enforcers, of which Ofsted, the FE Commissioner and the Education and Skills Funding Agency (ESFA) are currently key players. Therefore, the centrally derived need to control institutions makes it common sense for College leaders to shape the behaviour of employees towards governmental

objectives. The best way to regulate behaviour of Colleges is to actively, and increasingly, distrust College leadership through the use of strategic policy intervention. In his critique of Ofsted, Coffield (2017) demonstrated that in some cases, school leaders welcomed regular visits from the inspectorate as they believed it supported them to push staff into altering their practices. Through the concept of the ‘social trap’, we can understand the need to ‘push’ in such a way arises when the stakes are high. Authoritarian tactics such as this then become necessary; contributing to high levels of distrust over time. Once distrust has been established, it can be difficult to escape the trap that is created by it (Rothstein 2005).

Conceived in this way, the ‘social trap’ of distrust in policy design described in *Figure 1* becomes a cyclical process which is perpetually reinforced in spite of itself. While the policy surge goes on, the critiques of it tend not to change. Instead, the constant churn of policy keeps the conditions ripe for uncertainty, while performative practice within institutions becomes embedded. When risk is introduced at every stage in the process, behaviour becomes easier to manipulate (Avis 2003).

Lazzarato (2009) contends that what lies at the heart of neoliberalism is not capital, but competition. Thus, for neoliberalism to survive, the conditions for competition need to be created, leaving individual actors and institutions vulnerable to ‘losing’. In creating levers which manipulate behaviour, the assumption is that individuals will act to protect themselves against uncertainty (Boocock 2015). In this sense, neoliberalism not only dictates what educationalists do, it *becomes* what educationalists do. Ball and Olmedo (2013: 85) state that “[neoliberalism] speaks and acts through our language, our purposes, decisions and social relations”. As such staff are at risk of becoming *subject*, rather than subjective.

The stream of policy which has been implemented since Incorporation has been predicated upon a low trust relationship with FECs, in which trust is conditional upon FECs meeting increasingly narrow targets. FECs are now solely responsible for success or failure. As such, falling success rates are the responsibility of individual teachers, just as failure to succeed is the responsibility of the student (Finlay et al 2007). Boocock (2015: 728) argues that ‘funding and targets are two of the most powerful levers’ used in government policy to meet retention and achievement targets on an institutional level, whilst keeping day to day governance at a distance. Top-down policy reforms assume certain levels of ‘self-interest’ (Boocock 2017) which allows the government to assert control under conditions of apparent ‘freedom’ (Steer et al. 2007). Coffield (2007) has argued that the use of such ‘steering mechanisms’ makes the need to control education professionals explicit.

The policy strategies taken on by institutions meant that students from disadvantaged backgrounds were less valued under this new economic framework of education (Boocock 2015), demonstrating decreased trust in students as well as staff. As Smith (2007: 43) has reflected in his work on the impact of the ‘quasi-market’ environment, ‘the “preferred student” carries no baggage, needs no extra

support... is *predictable* in being able to achieve accreditation' (emphasis added). This need to predict outcomes for students demonstrates why a low-trust environment becomes essential to institutional survival in a competitive market.

The externalisation of quality assurance, and what constitutes quality also allows the state to impose punitive penalties upon those providers who do not meet the appropriate levels of 'rigour' and 'standards'. Illsley and Waller (2017) contend that the standards agenda curbed much of the discussion regarding curriculum development and practice, which in effect led to an increasing focus on 'college' needs rather than 'student' needs. In doing so, it set the template for establishing control on an institutional level. In essence, autonomy is afforded upon very specific terms. Therefore, the need for an institution to survive takes primacy over the needs of students.

This problem was exposed by the *Wolf Review* (Wolf 2011), a report which accused colleges of cynically chasing funding from an ever-shrinking pot to provide 16-19 year-olds with 'inferior' low-level qualifications of little value; a practice which Allan (2017) argues has increased since the raising of the participation age in post-compulsory education. Smith (2007) refers to this kind of practice as the 'ducking and diving' nature of colleges, who to ensure institutional survival become preoccupied with self-interest. Therefore, through the lens of distrust, the recommendations of this report can be understood as an attempt to mitigate against a set of practices which were the result of assumed agent self-interest in (distrusting) institutional policy-making. The latest overhaul of FE provision has left the sector reeling with an ever-present sense of uncertainty, as the government turns its attention to reforming apprenticeship provision and prepares to roll out its flagship 'T-Levels' programme.

Since 2015, the Conservative Government's continuation of the austerity project has accelerated the skills agenda, coupled with crippling budget cuts. The report published by the Institute for Fiscal Studies captured a 40% reduction in funding over the last decade (IFS 2018). Colleges have struggled to stay afloat, often forced to merge with other providers in line with the Area Review process. The Area Reviews proposed a further 'rationalisation' of curriculum offer to focus on local and national industry needs whilst also maintaining 'tight fiscal discipline' in doing so (DBIS 2015). Further, the increased presence of the FE Commissioner and the Education and Skills Funding Agency (ESFA) have forced Governing Boards in FE to become preoccupied by the precarity of their financial position to avoid the risk of college closure due to financial ill-health.

The high risk policy environment, combined with a continuing austerity project (Ryan 2018), diminishes the capacity for FE organisations to enhance cooperation, creativity and autonomy amongst staff; factors which are key to building trust (Uslaner 2002; Rothstein 2013; Rothstein and Uslaner 2005). This has led Rothstein (2013) to assert that this is why the 'fish rots from the head down' in institutional hierarchies.

'Agents in a group that have lost trust in one another cannot easily mimic or fabricate the

level of trust needed to ensure collaboration, even if they all know that they would be better off if they could' (Rothstein 2013:1012)

### **New Public Management: self-interest, survival and distrust in the organisational context**

The discussion so far has demonstrated that the move towards free-market practice in the public sector has been accompanied by the rhetoric of individualism; incentivising self-interest through the creation of a high risk, high stakes environment. In order to manage this level of uncertainty, a new style of management has emerged. Commonly referred to in the literature as New Public Management (NPM), this style of management can be considered the backbone of a modern neoliberal state. According to Clarke and Newman (1997), 'new managerialism' made efficiency an imperative in public sector management: this would allow for the creation of a more efficient government at a reduced cost within a high stakes environment (Keep 2015; Vallentin and Thygesen 2017). Further, by relaxing regulation and reducing the power of the unions, NPM practices also supported managers to establish the 'right to manage'. This so-called 'right to manage' is made legitimate by tools of audit and performance management.

In practice, the NPM approach has changed the nature of leadership in education and other public sector organisations. Leadership roles which were traditionally the occupation of experienced educationalists and pedagogues, have now become occupied by experienced business managers: preferring the title of 'Chief Executive' rather than 'Principal'. As such, the guiding principle of 'fairness' which might have traditionally been attributed to the spirit of public service, have instead been gradually replaced by principles of 'efficiency' (Vallentin and Thygesin 2017). Smith and O'Leary (2013) have described how leadership under NPM represents a quest to seek 'quantitative wholeness', whereby the only data which is considered meaningful is translated through figures. They assert that 'managerialist positivism... normalises the representation of complex sociological and qualitative phenomena in reductive and numerical forms' (Smith and O'Leary 2013: 246). Not only does this approach reinforce hierarchical norms within institutions, but also valorises numerical data to the exclusion of complex ecologies of practice which form the basis of meaningful educational relationships.

The distance that has been created between 'those at the top' and 'those on the ground' is stark, and O'Leary (2016: 10) contends that the work of principals has become so far removed from 'the realities of what it means to be a practitioner that it is debatable whether they have the skills or knowledge base to support improvements in teaching and learning'. This lack of faith in leadership was demonstrated by Hill (2000) when his research into lecturer perceptions of leadership revealed that less than 50% of teachers surveyed felt that they were trusted by their Governors or their College Management Team. Further, over 50% of the respondents also reported that the (then) FEFC and the Department for Education at the time were 'poor' at representing their professional interests.

## *The distinction between Trust and Distrust in the organisational context*

The establishment of a centralised, hierarchical system of management has been to the detriment of a more democratic system which would have been more conducive to building trust relationships (Boocock 2015). For example, a research study conducted by Vallentin and Thygesin (2017: 151) attributes NPM to the dissolution of trust in Danish public services, stating that ‘NPM reforms have been blind to the value of cooperation across public agencies... undermining trust’. The assumption that those at the centre know best, with limited opportunity for agents to contribute to decision-making or provide feedback is one of the central pillars of the system that has been created (Keep 2015). The sentiment that ‘followers’ need only follow has been further echoed by Coffield (2017) in his work evaluating the evolution of Ofsted.

In the organisational context, the work of Roy Lewicki and colleagues (Lewicki, Elgoibar, and Euwema 2016; Lewicki, McAllister, and Bies 1998) has illustrated that trust and distrust could be construed as two distinct concepts which can coexist within the same relationship. According to Lewicki, McAllister, and Bies (1998), trust is based on the confident *positive* expectations of another person’s conduct, while distrust is defined as confident *negative* expectations of another’s conduct. Therefore, disposition towards both trust and distrust can influence the way an individual engages within an organisation. This complicates our understanding of low/weak trust and distrust. Low or weak trust is based on weak ties or lack of collaboration, yet can still be considered a form of trust. Distrust, however, constitutes an assumption of malfeasance on the part of the potential trustee; leading to assumptions of negative outcomes and harmful motives from the ‘trustor’s’ perspective. Therefore, in the case of distrust, risk management becomes an essential feature of practice within institutions. Management of potential risks allows college leaders to incentivise employees to conform, thus allowing them to trust them to perform despite the presence of distrust.

According to Lewicki, McAllister and Bies (1998), the combination of ‘low trust’ and ‘high distrust’ in relationships leads to relations which are verified through the monitoring of ‘vulnerabilities’ and the reinforcement of ‘bounded relationships’. Therefore, the use of performance management and graded observations in FE could be construed as ‘low trust-high distrust’ tactics which result from a preoccupation with the risk and uncertainty created by the policy environment. This notion is reflected in the work of Thompson and Wolstencroft (2018) where they found that middle managers felt that they had been deceived as leadership fell through on their promises to afford them autonomy; instead enforcing the pursuit of corporate objectives.

This conceptualisation of the role of trust and distrust in organisational relationships makes explicit how the use of distrust in policy design can create the trust necessary to meet centrally defined standards. This illustrates the logic that would underpin the deliberate use of high distrust policies (observation, inspection, audit and performance management), which would allow those that create

policy to control, as far as possible, the conditions within which individuals can work. The high risk and uncertainty that is created by neoliberal competitiveness ensures that the work of policy-makers is mediated successfully by those leadership teams; who in this context exist to implement the policy that has been created. In effect, distrust reinforces the manager's right to manage.

### **Trust and Moral Space: On the breaking of bonds**

According to Sztompka (2017: 4-7), trust is the cornerstone of what he refers to as the 'moral space' of social life. This space is characterised by six moral bonds, namely; '*trust, loyalty, reciprocity, solidarity, respect and justice* ... [of which] trust has a special rank among them. It is most fundamental in the sense that all other bonds either presume or imply some measure of trust' (ibid: 4). The relentless drive towards productivity and competition reflected in governmental priorities (those that create policy), and their use in practice (those that implement policy) constitutes a break of these moral bonds which would connect them to those who work in FE (the subject of policy). The act of severing these bonds creates an environment in which reparation becomes difficult. If we can understand the decision to trust as requiring the *trustor* to be vulnerable, then it is possible to understand why trust is so much more difficult to repair than it is to lose, as it is the willingness to be vulnerable that makes trust such an elusive concept (Sztompka 2008; Rothstein 2005; Lewicki et al 2016).

Neoliberal policy and NPM therefore represent the antithesis of the bonds of solidarity, respect and reciprocity which according to Sztompka (2017) are so crucial in the creation of trusting relationships. In such an unstable and hostile policy environment (Lucas and Crowther 2016), where the stakes are high, all bets are off. Instead, it has been argued that in FE, risk is 'passed down the social structure so that the costs are often carried by those who are placed at the base of organisational hierarchies' (Avis 2003: 329). This risk is organisational, as well as individual due to the 'high stakes' environment in which teaching currently takes place (O'Leary 2015).

In a context where institutional trust is low, and the risks are high, it makes more sense to distrust than to trust. In this way, conditional outputs are filtered through the structure from the top of the hierarchy, starting with Government policy. Simply put, controlling those subject to policy is easier than trusting them. Control 'reduces complexity by regulating the number of possible outcomes' (Vallentin and Thygesin (2017: 154). This is compatible with a neoliberal mind-set, as Lazzarato (2009: 120) argues that while the entrepreneur is free, 'the freedom of the worker and consumer... are made subordinate'.

### ***Control and resistance in the construction of Distrust***

So far, this article has conceptualised how neoliberalism could influence the design of policy and the creation of distrust. Such distrust fundamentally shapes relationships between various actors in the FE

sector. This has led to a leadership approach which has permeated the sector, characterised primarily by the ‘deliberate control of professionals, the introduction of business models... and the development of a managerial caste with its own value system’ (Gleeson and Shain 1999, cited in Stoten 2014: 512). The following section will attempt to explain how a high-distrust environment has legitimised and perpetuated the need to control individuals, but also how distrust can allow individuals to express their refusal of the status quo. The established norm of creating policy without consultation with any stakeholders serves to isolate those who are supposed to implement and carry out the policy (Keep 2006, 2015). In such circumstances, new networks have emerged in response to, and often in ideological opposition to, those that create policy (Stoten 2014; Lewicki et al 2016). Therefore, it is necessary to conceptualise trust and distrust as a reciprocal process; in this case through the imposition of, and resistance to power.

#### ***The distrust dilemma in the mitigation of risk***

The pressure on school and college leaders to exercise control over their staff has been eloquently demonstrated in Coffield’s (2017) work on the role and impact of Ofsted upon teaching practice on the English education system. Buoyed by the oft-quoted assertion from the inspectorate that ‘*the* most important factor in improving standards is leadership (Coffield 2017: 11), leaders use the responsibility they are charged with the deliver ‘standards’ to shape teaching practice. We can perceive the act of distrusting not only increases control, but in the worst cases uses fear to support it (ibid). Distrust effectively permits the legitimate pursuit of excessive control of those further down the power structure, an approach which was found to be prominent in Stoten’s (2014) research into leadership style in FE.

Further, the logic of individualism and competition inherent within a neoliberal environment allows those in positions of power to account for problems in the education system to an individual, or set of individuals. The workings of this logic can be seen in practice through the activity of the FE Commissioner, ‘intervening’ in colleges who have failed to meet the required standard. This logic dictates that those who succeed within the neoliberal environment are ‘virtuous’ (De Lissovoy 2018), whilst those who fail or object are without virtue.

In such an environment, leadership within individual FE institutions are presented with a dilemma. As Boocock (2011: 417) notes, for example:

‘an overemphasis on self-governance and open systems would allow productive potential... but might also lead to free-riding and to a lack of regard for the goals of government. Conversely an over focus on the hierarchy... might direct self-interested college agents to the goals of governance at the expense of innovation...’

This conundrum provides us with a link back to Page's (2017) assertion at the start of this paper that the external environment forces the hand of college governors and leadership teams when making decisions. While the effect of distrust is to curb creativity, autonomy and agency (Boocock 2011; O'Leary and Wood 2017; Thompson and Wolstencroft 2018), trusting represents much higher perceived risks which threaten intervention and observation by various arms of government. Conversely, policies of distrust are risk-averse, safe, and do not tolerate deviance (Hill 2000; Coffield 2017; Boocock 2011). A study by Thompson and Wolstencroft (2018) found that various 'control mechanisms' were utilised such as micro management, interference, constant judgement, unreasonable demands and excessive monitoring by senior leaders in order to establish conformity. As such, it was control that allowed leaders to better predict the likely positive outcome in an environment which faces the constant threat of audit. In the act of withdrawing trust, or threatening to withdraw trust, the 'threat of removal is used as a sanction and a control mechanism' (Skinner, Dietz, and Weibel 2014: 216).

Control is required when risk is high, reflecting Page's (2017b: 2-3) understanding that 'the proliferation of teacher surveillance, from learning walks to parental networks is driven by a preoccupation with risk... [the need to] know the future as if it has already passed'. O'Leary and Wood (2017) have further observed that even though OFSTED no longer grade individual teachers (Ofsted 2018), college leadership teams in many cases continue to grade individuals due to the 'deeply engrained practice' of observation. This demonstrates how difficult rebuilding trust can be, once it has been lost. As a result, policies of distrust successfully control behaviour through fear of consequences (Gleeson, Davies, and Wheeler 2005).

The instruments used by leadership teams such as audit, observation and performance management work to undermine the values of individual actors in the system by encouraging them to work towards extrinsic rather than intrinsic goals (Boocock 2017). Boocock (2017: 301) has further argued that the apparatus of distrust also shapes the behaviour of leadership teams, as the pressure to 'conform to central policy diktats' has been at the expense of 'senior manager agency and local decision making'. He concluded that this has effectively shut down the availability of critical spaces for effective reflection on quality (Boocock 2011) and open governance (Boocock 2017). The insecurity inherent in the competitive environment therefore induces anxiety into both institutions and individuals as they are made 'responsible for the conditions they confront and for their ultimate destinies in this context' (De Lissovoy 2018: 23). Anxiety, as expressed by De Lissovoy (2018) names the tension inherent in the system and the potential crises of institutions within a free-market environment, which exists to create winners and losers.

### ***Reciprocal Distrust as a form of ideological resistance***

The palpable lack of trust has led some educationalists to seek solace in those who share the same

values as they do. The perceived ‘logic’ of incorporation as a means of control has neglected the values which many teaching staff hold dear (Lucas and Crowther 2016). The response has been in some cases to reciprocate the distrust they experience based on a lack of mutually shared values. Smith (2007) has argued that commonly shared goals and values associated with their practice such as social justice and community empowerment (often centred around localised knowledge) is inconsistent with the values of NPM. Therefore, the desire to form cross-institutional networks such as ‘Tutor Voices’ (a network of further education college lecturers who founded a forum in which best practice could be debated and shared) in resistance to ‘untrustworthy’ leadership and government functions as a symbolic refusal to trust the system in which they find themselves. In doing so they can, to some extent, reclaim their identity and exercise their agency to believe and act differently to the status quo (Petrie 2015). This reflects what (Ball 2016: 1139) might refer to as the ‘politics of refusal’ in which ‘speaking plainly when there is a difference in power between the speaker and the listener [and] speaking frankly even when it flies in the face of the prevailing discourse’ becomes paramount in the assertion of an identity (individual or collective) which reflects an outright opposition to the accepted practices of NPM in public education.

Counter-narratives of resistance and resilience in the face of significant financial and political challenges are abundant in the literature (see Daley, Orr, and Petrie 2015 for examples of subversion in FE). Indeed, Coffield et al (2007: 728) remind us that ‘policy makers are not writing upon a blank slate, but on a page already made up of ‘ecologies of practice’...and as such the hereditary values of the adult education movement remain evident in pockets of the sector (Field 2006). Mycroft (2016: 419) invites us to consider that ‘as neoliberalism tightens its hold, possibly its death grip... as educators we can seize this [opportunity to resist through practice] or let it happen to us’. The somewhat binary nature of Mycroft’s proposal is demonstrative of a withdrawn faith from the ‘led’ towards leadership. This practice of refusal makes explicit the ‘unwelcome trust’ given to them by those in power. According to Skinner et al (2014: 214), ‘unwelcome trust’ is ‘the reluctance to be trusted’ for a variety of reasons including when ‘the pressures of obligation may be intolerable... counter to their interests... or personal ethics’. In this way, active distrust towards those in power serves as a form of ideological resistance; making explicit who, and who is not, within the realm of their ‘moral space’, to borrow from Sztompka (2017).

This resistance, or reciprocal distrust, represents the fractured nature of institutional relations. It functions as ‘a rejection of comparison and improvement, and indeed of excellence’ (Ball 2016: 1141). This kind of resistance represents what Lewicki et al (1998: 9) would refer to as a ‘low trust-high distrust’ disposition towards authority. This involves relationships where negative outcomes are ‘expected and feared’, harmful motives are assumed and as such pre-emptive actions are required. This disposition towards leadership is perpetuated by the perception that those who are not *part of* the resistance are complicit in the oppression. This state of affairs between those that create policy, those

that implement policy and those that are subject to policy diminishes opportunities for trust repair; as each party continues to use strategies based upon distrust to protect their interests. As Page (2015: 157) has reflected in previous work: ‘in the very act of subversiveness we concede the loss of what lies at the heart of being professional: autonomy, authority and trust’.

The impact of reciprocal distrust between the key actors at play has resulted, to a greater or lesser extent, in an ideological stalemate. Lucas and Crowther (2016) have argued that neoliberal marketeering in FE has served to distract everyone in the field, resulting in what they refer to as ‘unorganised social spaces’ where discussion of core values in the FE sector relating professionalism and curriculum have been neglected.

### **Conclusion: Trust violated**

This paper sought to conceptualise the role that trust and distrust could play in the design and implementation of policy in the Further Education sector. In doing so, I have illustrated how Rothstein’s (2005) social trap phenomena can perpetuate policy churn, which manipulates institutions to conform to changing priorities based on a skills agenda; fuelled by national and global competition. Lewicki et al’s (1998) seminal work on the distinction between trust and distrust further aides us to understand how New Public Management practices necessitate a disposition of institutional distrust to verify employee compliance. Stzompka’s (2008) concept of ‘moral space’ allows us to understand how a lack of faith from leadership can lead to violations of trust which diminishes opportunities for organisational trust repair. Whilst this paper did not intend to make categorical statements around the deliberate use of distrust in this process, these theoretical concepts can support us to develop a deeper understanding of the utility of institutional and organisational distrust in manipulating behaviour within a homogenous policy environment; and how resistance to policy hegemony can result in withdrawn faith from leadership. In effect, this paper sought to answer the question ‘*what if* distrust was intentional?’ from a theoretical perspective. By exploring this question conceptually, this paper can directly address the violation of trust associated with the increased surveillance of teachers; which has reduced the scope for individual autonomy and creativity.

The acceleration of policy initiatives since 1992 demonstrates a lack of trust in institutions to achieve success in the long term. Increased regulation it has, contrary to the rhetoric, reduced financial and curricula autonomy. By conceptualising the role that distrust might play in this process, this paper posits that over time a ‘social trap’ of reciprocal high distrust and conflict has been created; driven by the struggle to establish a sense of control on the part of the institution, or maintain a sense of autonomy on the part of the individual.

This social trap increases individualism and reduces cooperation based on the general perception that others will also be uncooperative. The ‘stickiness’ of the problem (Uslaner 2002) is evident in the design and implementation of policy, which is subject to a perpetual sense of uncertainty and

instability. Hence, why the problem is such a ‘sticky’ one, as neither party has faith that they will work towards the common good, or the best interests of all concerned. Avis (2003) believes that trust is central to creative endeavour, yet it is absent from the organisational hierarchies that are typical of many further education institutions. He argues that risk-taking must take place in high-trust environments as “working conditions marked by hierarchical and segmented relations will fail to...lend themselves to creative endeavour” (Avis 2003: 320)

I have demonstrated in this paper that control-for-predictability is a form of policy-making with deep (intended or unintended) consequences. Within the context of FE, the constant state of flux in the policy environment prevents trust from flourishing. If we can understand that trust has been violated by acts of distrust caused by the ‘indominatable power’ of the external environment (Page 2017), we can also understand why these acts may be perceived as necessary by leaders within Further Education Colleges. Therefore, distrust constitutes useful mechanism to manipulate behaviour and ensure policy conformity.

However, Sztompka (2017: 8) contends that if ‘*trust* engenders security, predictability, readiness to initiate interactions and take risks, then *distrust* produces suspiciousness and anxiety which are paralysing for actions and interactions’. Therefore, although the perceived benefits of distrust may result in institutional conformity, the repeated violations of trust described in this paper have served to undermine the moral bonds of respect, solidarity and justice to the extent that an ideological stalemate has been created between those that create policy (government), those that implement policy (FECs), and those that are subject to policy (staff and students). This can be understood as maintained, even strengthened, through Rothstein’s (2005) social trap phenomena. These violations of trust threaten an individual’s sense of ‘existential safety’ (Sztompka 2017) and have therefore served to make FECs unsafe spaces to work, necessitating a meaningful resistance in which those involved may feel their ‘moral space’ will be respected, where their institutions fail to do so.
