Introduction

Google Scholar, a search engine to support scholarly research, came into use over a decade ago and was promoted early on by university libraries as one of many potential finding aids and as part of the ‘scholar’s toolkit’. Google Scholar, along with other developments in library systems to provide access to the world’s information, without doubt has signalled the end of the university library as perceived as a place constrained by its four walls. By the time it arrived on the information landscape, the ubiquity of Google had already been established with studies of its use, for example in Brophy and Bawden (2005) and Fast and Campbell (2004) suggesting it was preferred by students, along with calls to make the library catalogue ‘like Google’, based largely on the perceived ease of the keyword searching it enabled. As such, the impact that the search engine has had on the practice of the provision of the e-library and its services is the subject of many papers (for example, Fagan, 2014). However, the impact of this technology in the university e-library, in particular in terms of its role and services, is equally of interest when understood from the perspective of the university student, the user. This paper presents the findings of a PhD study that sought to determine how university students perceive one of the tools made available to them from a university e-library, Google Scholar (GS). In exploring students’ view of this search engine, and specifically the potential determinants of their behaviour (intended use of the search engine) the investigation seeks to offer the university library practical propositions regarding its role in promoting GS among its university students. In other words, this study aims to answer the question, ‘*do university students accept or adopt GS as a useful tool in finding scholarly information and what are the factors that influence this acceptance and ultimately predict use*’. By focusing on understanding how GS is perceived, the aim is to draw attention to determinants of user behaviour and in doing so offer insights into how the university library might best promote and facilitate students’ effective use of GS in the context of the e-library.

Given the specific aim, this paper reports on postgraduate students’ intention to use Google Scholar in the context of their research studies. The study focuses on the views of international postgraduates studying in the UK, as part of a larger study on their use of library digital resources whilst studying overseas. The study chose postgraduate students, in general, as the focus as their information needs are more advanced and complex than those of undergraduate students (Catalano, 2013). The scrutiny was directed towards international postgraduate students, in particular, since they constitute a considerable proportion of the student population in the UK (OECD, 2018), the UK being a popular destination for international students (Marginson, 2018). Moreover, the UK’s Council for International Student Affairs ([UKCISA], 2019), reports that nearly two-fifths (19%) of the students undertaking postgraduate programmes in the country were international students indicating that this was a population that merited consideration.

An explanation for technology use and the theory on which the investigation is based is that of Venkatesh *et al.*,’s (2003) Unified Theory of Acceptance and Use of

1
2
3 Technology (UTAUT). This model consolidates previous theories (such as Davis'
4 Technology Acceptance Model (TAM), Davis, 1989) to explain people's adoption of
5 technology and provides insight into the factors influencing behavioural intention. In
6 particular, the theory enables research to explore beyond the prevailing reported influences of
7 ease of use, efficiency and convenience, and draws fairly heavily on the context of the user,
8 such as the influence of factors such as their self-efficacy, a belief in one's ability to carry out
9 a task. For this reason, and as explained above, the study focuses on the fairly narrow user
10 group, of international postgraduate students. In this paper, the approach taken to the user
11 survey is outlined and the findings analysed to suggest the main factors that appear to
12 influence the student's perception and intended use of Google Scholar. In addition, we
13 discuss how this study and its findings offers further insights into the role of the university
14 library in providing and facilitating use in context of the e-library and its services.

19

20 21 **Background**

22 23 *Electronic (E-Libraries) or Digital Libraries in the University Context*

24
25
26 Information and communication technologies (ICT) have become an essential constituent of
27 traditional and distance systems of education (Hrtoňová *et al.*, 2015; Nirban and Chasul, 2014).
28 Consequently the electronic (e-library) or digital library, has become an integral part of the
29 educational context to provide convenient access to research and academic resources through
30 the course of a student's academic existence (Hwee and Yew, 2018). The functions of an e-
31 library are similar to its traditional counterpart and include searching, locating and copying,
32 requisitioning and obtaining e-books and e-journals (Park *et al.*, 2009; Sheeja, 2010).
33 Nevertheless, they have significant advantages over traditional libraries including the ease with
34 which digital resources can be monitored and accessed, and with the provision to use search
35 engines to search for necessary resources (Hwee and Yew, 2018). In the university context, an
36 e-library could be understood to be an academic or university library website. Liu (2008) stated
37 that an academic library website offers access to "online catalogs, electronic databases, subject
38 resources, library instruction/tutorials, and digital collections" (p. 6) and where through this
39 centralisation the effort required by users in locating information is reduced and moreover,
40 where the "changing needs" of users can be supported as the development of ideas, learning,
41 and capabilities are cultivated (p. 14.). The academic library website becomes the centre for
42 the "dissemination of digital information; the portal to a multitude of e-resources and e-
43 services; the main gateway for virtual users; and a marketing tool allowing libraries to project
44 their image" (Al-Qallaf and Ridha, 2018, p. 1).
45
46
47
48
49
50
51
52

53 54 *Google Scholar in the University Library*

55
56 Jacsó (2005) chronicles the recent history of the Google Scholar search engine from its
57 inception in November 2004 and, whilst he critiques it with regard to content omissions, the
58 conclusion reached was that, with future development, Google Scholar will become an
59 excellent free tool for scholarly information discovery and retrieval. Subsequent analysis of
60

1
2
3 the advantages and disadvantages have criticised its incomplete index and regulated
4 vocabulary shortfall (Cathcart and Roberts, 2005) whilst others have lauded its links to the
5 full text URL, when available, from locations such as university repositories (Lercher, 2008).
6 The number of available scholarly documents on the internet has been projected by Khabisa
7 and Giles (2014) to be at least 114 million (in the English language) and of which at least 100
8 million are accessible using Google Scholar and 27 million available freely. More recently, in
9 2018, it has been estimated that the size of GS is approximately 398 million documents
10 (Gusenbauer, 2019) which however, keeps growing as GS indexes material on the Internet.
11 The key to its success is often attributed to its capability to link full-text articles directly, to
12 recover interdisciplinary results and to search articles from repositories and open access
13 journals (Hartman and Mullen, 2008; Neuhaus *et al.*, 2008) and, as such, it is not surprising
14 that GS has been promoted by various libraries as a replacement to subscription databases
15 (Arendt, 2013). Only 8 months after its release, Hartman and Mullen in 2006 reported that
16 GS was listed on the alphabetical list of vetted scholarly database and indexes in 73 libraries
17 out of 113 university members of the Association of Research Libraries, and Neuhaus *et al.*,
18 in 2008, reports that 73% of US universities and colleges in the United States provide GS
19 mediated link resolution from GS records to licensed full text library resources. Furthermore,
20 about third to a half of all institutions were using a Google powered campus site search
21 engine which advertises GS to all who search the academic website. Whilst web search
22 engines, such as Google, have caused much debate within the field of library and information
23 science, Jamali and Asadi (2010) report that academics (students, faculty members, and
24 research staff) in their study preferred to utilise web search engines such as Google. Studies
25 such as these might suggest that GS is in competition with database vendors, publishers and
26 libraries but rather it is used and indeed promoted at institutional level as a discovery tool for
27 finding information.

38 39 *Use and adoption of Google Scholar*

40
41 The use and adoption of various search tools by students in Higher Education explores the
42 user perspective. The popularity of Google Scholar with academics (Ollé and Borrego, 2010)
43 and students (Cothran, 2011) may be attributed to its keyword search using Google's ranked
44 retrieval and its search feature 'cited by' which allows the searcher to trace related articles for
45 a published paper. Tella *et al.*, (2017) survey of postgraduate students of the University of
46 Ilorin, Nigeria reported that their views were based mostly on its broad subject coverage and
47 often links to the full text. Studies of intention to use technology, based on the Technology
48 Acceptance Model (TAM), further investigate the constructs of a person's perception of
49 technology (such as perceived usefulness and perceived ease of use). In the context of earlier
50 concerns that digital libraries were not used as frequently as they could be Hong *et al.*, (2002)
51 explored perceived ease of use and perceived usefulness and identified that, for digital library
52 technology, both were impacted by organisational environment. In exploring this further, the
53 role played by 'self-efficacy' (Bandura, 1999), a belief in one's capacity to act to achieve
54 one's goals, has been investigated as extending the potential determinants of students' use of
55
56
57
58
59
60

1
2
3 the digital library technology (and search engines). As a result there appears to be a current
4 generation of university students who have a familiarity with technology, and possibly a
5 dependency, to the extent that they are often perceived as confident in their ability and 'self-
6 efficacy' to find the information they need and to do so unaided by a library service or
7 librarian as intermediary (Mi and Nesta, 2006). Research has recognised the potential role
8 played by self-efficacy and studies such as that of Ramayah and Aafaqi (2004) have found
9 there is a direct impact from self-efficacy on perceived ease of use and perceived usefulness.
10 With regards specifically to Google Scholar it is possible that further individual factors
11 contribute to a perceived benefit in using GS, for example Cothran (2011) survey of 1,114
12 graduate students enrolled at the University of Minnesota and reported a 'sense of loyalty' as
13 an influence.

14 15 16 17 18 19 20 *Measuring student perception of Google Scholar*

21
22 The previous discussion has suggested it is possible to identify and model the key influences,
23 in particular the constructs of people's perceptions of the usefulness and ease of use of
24 technology in its 'use context'. In the context of the postgraduate university library user
25 seeking scholarly information, we propose that extensions to TAM with its key determinants
26 of perceived usefulness and ease of use are necessary to identify and attempt to understand
27 further contextual determinants and their possible influence on the acceptance and use of GS.
28 Therefore the aim is to explore both the *task orientated* influences of perceived usefulness
29 and ease of use, as well as the user perception of possible *contextual* influences. To this end,
30 Venkatesh *et al.*'s (2003) proposed Unified Theory of Acceptance and Use of
31 Technology (UTAUT) is utilised. Gruzd *et al.*, (2012) suggest that UTAUT is now most
32 frequently used in studies investigating the reasons why people choose to adopt or choose to
33 reject an information technology. The model was established after the testing of the eight
34 previous technology acceptance theories: the theory of reasoned action, the motivational
35 model, the technology acceptance model, the theory of planned behaviour, the combined
36 TAM and TPB, innovation diffusion theory, social cognitive theory, and the model of PC
37 utilisation. The outcome was a consolidation of the influencing factors reflecting people's
38 goal-orientated social and psychological motivations and identified four key constructs (or
39 independent variables) of Effort Expectancy (EE), Performance Expectancy (PE), Facilitating
40 Conditions (FC), and Social Influence (SI) as direct determinants of acceptance of a
41 technology (Venkatesh *et al.*, 2003). The popularity of the UTAUT is evident as insights can
42 be drawn from its application in different contexts. For example, Yang and Lee (2007)
43 utilised the UTAUT framework and found that in Korea, adoption of information
44 technologies is impacted significantly by Social Influence and Performance Expectancy;
45 interestingly, they reported that this is not the case in the USA, leading to speculation that the
46 differing factors relating to culture and values may be influencing technology acceptance.
47 The impact of contextual factors, such as culture or attitudes to knowledge sharing has been
48 explored in regards to the use of technologies in contexts ranging from e-government to
49 mobile learning (for example, in Baptista and Oliveria 2015, Al-Hujran *et al.*, 2015, Hoque
50
51
52
53
54
55
56
57
58
59
60

and Bao,2015). Use of the UTAUT framework in the context of postgraduate student perception of GS therefore is based on the four constructs or independent variables PE, EE, SI and FC of technology use.

Method

Measurement development

The four constructs of UTAUT as detailed below and a set of measurement statements drawn up for each, form the questionnaire that was distributed to the study participants. Additionally, as suggested in the literature, sets of statements were included that could provide a measure on a Likert scale of Self-Efficacy (SE), Domain Knowledge (DK), Computer Experience (CS), Motivation (MO), and further Visibility (VI), Accessibility (AC) and Relevance (RE). A five-point Likert scale, representing responses of ‘strongly disagree’ to ‘strongly agree’ respectively, was utilised in the questionnaire. This scale was chosen as we wanted to use factor analysis to combine the responses to the statements and generate a composite score for each. The validity of these statements as indicators of each of the factors was confirmed in factor analysis and were further grouped as relating to either individual (internal) context influences (SE, DK, CD, MO) or external system influences (VI, AC, RE). The relationships held amongst all of the factors in the questionnaire (PE, EE, SI, FC, SE, DK, CS, MO, VI, AC, RE) were explored to understand each as influencing the students’ perception (with respect to intended use) of Google Scholar. Each factor is detailed as follows.

Performance and Effort Expectancy

Performance expectancy (PE), is defined as ‘*the degree to which an individual believes that using a system will help him or her attain gains in job performance*’ (Venkatesh *et al.*, 2003) and concerns how informative, useful, meaningful and significant and helpful the information service is for the user (Dwivedi *et al.*, 2016). Effort Expectancy (EE) defined in Venkatesh as ‘*the degree of ease associated with the use of the system*’ and further concerns the extent of convenience perceived for using a system. In the context of students’ e-library services acceptance (Awwad and Al-Majali, 2015) both PE and EE are considered to be task oriented and non-emotional perceived gains from use and may promote user’s behavioural intention. In this study it is proposed that the perceptions of PE, perceived benefits gained from use, and EE, perceived usable and effortless in seeking scholarly information, influence the postgraduate students’ intention to use Google Scholar. The following statements relating to PE and EE were adapted from Venkatesh *et al.* (2003) and Awwad and Al-Majali (2015) and included in the questionnaire as:

- PE1 Enables me to improve my study performance
- PE2 Enables me to achieve study/research task
- PE3 Helps me accomplish my study more quickly

- 1
- 2
- 3 - PE4 Increases my productivity
- 4 - PE5 Be beneficial to my study
- 5 - EE1 It is easy for me to become more skillful in using it
- 6 - EE2 I will continue to find it easy to use
- 7 - EE3 Learning to use it does not require much effort
- 8 - EE4 My interaction with it will continue to be clear and understandable
- 9

10

11 *Social Influence and Facilitating Conditions*

12

13

14 Social influence (SI) has been defined as ‘*the degree to which an individual perceives that*

15 *important others believe he or she should use the new system*’ (Venkatesh *et al.*, 2003, p.451)

16 and in the regards to postgraduate student use of GS, previous studies of e-library use suggest

17 that SI may have strong and direct influence on behaviour intention. For example, Cothran’s

18 (2011) study involving undergraduate students found SI of the peer group and student tutors

19 were a key influencing factor motivating use. Further, Cothran’s, (2011) suggested loyalty as

20 a factor and found that people’s use of Google for searching the web have reported the

21 influence of others and perceived popularity of the engine to be a key determining factor (Oh

22 and Colón-Aguirre, 2019). Facilitating conditions (FC) are defined by Venkatesh *et al.*,

23 (2003) as ‘*the degree to which an individual believes that an organizational and technical*

24 *infrastructure exists to support the use of a system*’ (p.453). This is interesting as GS may be

25 offered as one of many resources available from the university library as recommended and

26 promoted for searching for journal articles and conference papers, alternatively it can

27 accessed directly via the URL scholar.google.co.uk. In this study it is presupposed that SI and

28 FC would influence the postgraduate students’ intention to use the library resources hosted or

29 promoted by the university library, of which Google Scholar is one. Statements relating to SI

30 were adapted from Awwad and Al-Majali (2015) and FC from Jeong (2011) and included in

31 the questionnaire as:

32

33

34

35

36

37

38

39

- 40 - SI1 People whose opinions I value prefer that I use it
- 41 - SI2 People who are important to me at my university think that I should use it
- 42 - SI3 People who influence my study think I should use it
- 43 - SI4 I am encouraged to use it by people who assess my work
- 44 - SI5 I use it because people around me do
- 45 - SI6 Not using it makes me feel I am falling behind others
- 46 - FC1 It is suitable for the way I study
- 47 - FC2 I can get help when I have difficulty
- 48 - FC3 The help can direct me to the information I need
- 49 - FC4 The help supports me in my tasks/research study
- 50 - FC5 Other students show me how to use it
- 51 - FC6 I have been trained to use it
- 52
- 53

54

55 *Extensions to Unified Theory*

56

57 We believe further contextual factors influence student use of GS, such as and in particular

58 the self-efficacy of the postgraduate student. Venkatesh *et al.* (2012) also explored factors

59 influencing undergraduate student use and added the factor Motivation defined as ‘*the fun or*

60

1
2
3 *pleasure derived from using a technology*'. Hedonic motivation is unlikely to have particular
4 influence as a determinant of the postgraduate students' adoption and use of GS, however the
5 contextual factor such as self-efficacy might. It is important to extend the model to focus on
6 context and aspects of that may impact on shaping behaviour. For example, in the context of
7 searching for scholarly information Umukoro and Tihamiyu (2017) found that student use of
8 the e-library was predicted on the basis of certain service factors including self-efficacy.
9 Furthermore they found that the factors inhibiting the use of the e-library included lack of
10 awareness and absence of training. Jeong (2011) added Self-Efficacy (SE) defined as *An*
11 *individual's perceptions of his or her ability to use computers to accomplish a task*', and
12 Sumayyah and Patel (2012) added Domain Knowledge (DK) *'The person's knowledge of a*
13 *particular discipline, domain, or area that is relevant to the search*; Computer experience
14 (CS) *'The amount and type of computer skills a person acquires over time*' and Motivation
15 (MO). Informed by previous studies of factors influencing digital library use, such as Hong *et*
16 *al.*, (2002) and Park *et al.*, (2009) further factors were identified relating to facilitating
17 conditions of the system and its perceived Visibility (VI), defined as *'The degree to which a*
18 *system is observable or apparent in an organization*' (Thong *et al.*, 2002), its Accessibility
19 (AC) defined as *'The degree of convenience with which an individual accesses an*
20 *information system*' (Park *et al.*, 2009) and its Relevance (RE) *'The degree to which the*
21 *system matches tasks as carried out in the current environment*' (Thong *et al.*, 2002). The
22 following statements were adapted from Park *et al.*, (2009) for the factors SE and AC, from
23 Thong *et al.*, (2002) for VI and RE, from Abdullah *et al.*, (2016) for the factors DK and CS,
24 and from Sumayyah and Patel (2012) for Motivation (MO).

Predicted Model

Figure 1 presents the conceptual model and hypothesised relationships of this study where PE, EE, SI, FC influence BI. In this way, it is predicted that when postgraduate students perceive that PE, EE, SI and FC are fulfilled, then behavioural (continuance) intention may be promoted. Behaviour Intention is considered as an individual's intention to use a particular technology that directly affects actual usage. The modelling of the factors enables further exploration of the influence between the types of factors, that is of the task focus of PE and EE and of the social and organisation infrastructures (particularly the university library context) of SI and FC that may influence use. Furthermore it is hypothesised that in the postgraduate student use context, the factors added Computer Experience (CE), Domain Knowledge (DK) and Self-Efficacy (SE) are expected to have a strong influence with perceived Effort Expectancy (EE) influencing use, and further that perception of system Accessibility (AC), Visibility (VI), and Relevance (REL) are expected to have a strong influence with students' perceived Performance Expectancy (PE) and thus intention to use.

<<< *INSERT Figure 1: The Study's Conceptual Model* >>>

Content Analysis

A second version of the questionnaire was also created which included an open-ended question to ask the participants for the reason for their preference for Google Scholar as a search tool to use. The content analysis of the responses to the open-ended question was undertaken in stages, using hybrid coding which is a combination of deductive and inductive coding (Fereday and Muir-Cochrane, 2006). The system of coding was developed gradually and collaboratively as were the categories and themes subsequently derived from the coding. The codes developed corresponded to the reasons provided by the students for their choice to use Google Scholar. That is, *what could precisely and definitely identify their reasons for using Google Scholar?*

Sample and data collection

The questionnaire was distributed to 200 international postgraduate students studying across academic disciplines but in a single UK city namely, Manchester. The postgraduate students were recruited through convenience sampling technique and based on their availability and

1
2
3 accessibility on the university campuses (Ghauri and Gronhaug, 2005). The target n=200 was
4 not a calculated representative sample size required for generalisation of the results, rather the
5 target number provided a data set which could be questioned using factor analysis based on
6 the conceptual model. There were 118 male students and 82 female students (59% and 41%,
7 respectively). Further, the majority 70% (n=141) fell into the age group of 24-30, followed by
8 19% (n=38) aged 31-40, with 6.5% (n=13) from the 41 or older age group and 4% (n=8) from
9 the under 23 age group. The majority of the students 86.5% (n = 173) were master's students,
10 while 13.5% (n =27) were doctoral students. The questionnaires asked the respondent to write
11 a brief description on their current research and then posed the question "*thinking about your*
12 *use of Google Scholar in respect to your current postgraduate research.*" Respondents were
13 asked to respond on a Likert Scale 1-5 (strongly disagree to strongly agree) to each of the
14 statements related to the influencing factors and to their intention to use Google Scholar. Out
15 of the 200 participants, 20 students received the version of the questionnaire containing the
16 single open-ended question. This was based on the general rule of thumb given in Connelly,
17 (2008) that responses to this additional question, from 10% of the actual study sample (n =
18 200) would be representative.

26 *Reliability of the Questionnaire*

27
28
29 The reliability of the questionnaires utilised in the study were analysed using Cronbach's alpha
30 (Ritchie and Lewis, 2003). All items that exhibited Cronbach's value of >0.5 were classified
31 as acceptable in the present study (Hinton *et al.*, 2014). The Cronbach's alpha coefficients were
32 found to range from 0.64 to 0.91, and were above 0.5 and mostly above the sometimes cited
33 value of >0.7. Overall, the items in the questionnaires utilised in the study were found to be
34 acceptable for use (Table 1).

35
36
37
38 <<< *INSERT Table 1. Cronbach's Alpha for Students' Perceived Use of Google Scholar and ULW*
39 >>>

44 **Results**

45
46
47 Analysis was performed using Confirmatory Factor Analysis (CFA) to assess the reliability
48 and validity of the contextual influencing individual factors of SE, DK, CE, MO and system
49 factors VI, AC, RE and then a second stage to the analysis was based on Structural Equation
50 Modelling to examine the relationship held amongst all the constructs in the predicted model.

51
52
53
54 The item loadings ranged from 0.345 to 0.964, with 19 out of the 28 items having loadings
55 greater than 0.7, which is considered to be the minimal value for construct validity. A few items
56 were dropped from the constructs Relevance (RE) and Computer Experience (CS). The AVE
57 (average variance extracted) exceeds the minimal value 0.5 for 6 of the 7 sub-constructs that
58 is, except Computer Experience where the AVE is 0.405. Similarly, the CR (Composite
59
60

1
2
3 Reliability) exceeds 0.7 for 6 out of the 7 sub-constructs except Computer Experience where
4 the CR is 0.646. This indicates that the scale has reasonably good validity (Fornell and
5 Larcker, 1981) as the majority of the constructs have values of AVE and CR which are
6 greater than those recommended.
7
8

9
10 <<< INSERT Table 2. Standardised item loadings, AVE, CR, and Alpha Values >>>
11
12
13
14

15 Following this, Structural Equation Modelling (SEM) was utilised to estimate the structural
16 model (Figure 2). Behavioural Intention (BI) was considered to be the chief construct that
17 denotes the intention of students to utilise Google Scholar. Hence, this construct was
18 considered to be the model's main endogenous factor. Effort Expectancy (EE), Performance
19 Expectancy (PE), Facilitating Conditions (FC), and Social Influence (SI) were regarded as the
20 exogenous variables whose influence on BI is examined through the model. Individual
21 Differences (ID) and System Features (SF) are included to scrutinise their impact on EE and
22 PE respectively. The statistical package AMOS (v21.0) was utilised for the model
23 development.
24
25
26
27
28
29
30

31 <<< *INSERT Figure 2. Structural Equation Model using AMOS* >>>
32
33
34
35

36 The model fit (Table 3) report the indices of the scales obtained for the structural model. The
37 CMIN / DF of 4.476 indicates that the model is a good fit since the value is within the
38 guideline value (<5). The values of CFI (.854), NFI (.906), RFI (.873), IFI (.869), and TLI
39 (.924) are close to 0.9 indicating the goodness of fit of the model.
40
41
42
43
44

45 <<< *INSERT Table 3. Model Fit Indices* >>> (Note : χ^2/df is the ratio between Chi-square
46 and degrees of freedom, NFI is the Normed Fit Index, RFI is the Relative Fit Index, IFI is the
47 Incremental Fit Index, TLI is the Tucker Lewis Index, CFI is the Comparative Fit Index, and
48 RMSEA is Root Mean Square Error of Approximation)
49
50
51
52

53 The examination of the SEM (Figure 2) and (Table 4) reveal that Performance Expectancy
54 (PE) is found to significantly influence students' Behavioural Intention with 0.257 as the
55 standardised estimate (β coefficient) ($p < 0.05$). Moreover, Effort Expectancy (EE)
56 significantly influences students' Behavioural Intention with 0.216 as the standardised
57 estimate (β coefficient) ($p < 0.05$). However, Social Influence (SI) does not significantly
58
59
60

1
2
3 influence students' Behavioural Intention with -0.098 as the standardised estimate (β
4 coefficient) ($p>0.05$). Again, Facilitating Conditions (FC) does not significantly influence
5 students' Behavioural Intention with 0.063 as the standardised estimate (β coefficient)
6 ($p>0.05$). Nevertheless, System Features significantly influences students' Performance
7 Expectancy with 0.311 as the standardised estimate (β coefficient) ($p<0.05$). Moreover,
8 Individual Differences significantly influences students' Effort Expectancy with 0.551 as the
9 standardised estimate (β coefficient) ($p<0.05$). The hypothesis statements are recast as
10 accepted or rejected accordingly (Table 5).

21 22 23 24 **Discussion**

25
26
27 The model of postgraduate student perception of Google Scholar, with regards to intention to
28 use, in this study is based on perceived Performance Expectancy and Effort Expectancy.
29 These were defined in Ventakesh *et al.*, (2003) as task orientated and non-emotional
30 perceived gains as in '*the degree to which an individual believes that using a system will help*
31 *him or her attain gains in job performance*' and '*the degree of ease associated with the use of*
32 *the system*'. In the context of international postgraduate students, the contextual (specifically
33 social and organisation) factors of Social Influence and Facilitating Conditions did not appear
34 to strongly influence the behaviour intention to use. Again Ventakesh *et al.*, (2003) defines
35 these factors as '*the degree to which an individual perceives that important others believe he*
36 *or she should use the new system*' and '*the degree to which an individual believes that an*
37 *organizational and technical infrastructure exists to support the use of a system*'. It is
38 interesting to consider the context of the previous research where both were influencing
39 factors in the resulting model. These such as Yang and Gui (2014), Yang and Lee (2007) and
40 Moorthy *et al.*, (2018) were undertaken in the undergraduate student context and /or with
41 respect to intention to use the e-library service or digital library rather than specifically
42 Google Scholar. With regards to the resulting model in this study postgraduate participants
43 appear to perceive Performance and Effort Expectancy as stronger determinants of use, and
44 certainly over the social and organisational influences of their peers and by the perception of
45 the university's facilitating use in its provision of the search tool in the e-library. This would
46 concur with the findings of previous studies such as Oh and Colón-Aguirre (2019) and
47 Cothran (2011) highlight the task orientation of the factors influencing use of GS. The
48 influence of the perception of the task performance and effort is further explored with the
49 inclusion, in this study, of the 'Individual' factors, SE, DK, CE and MO, and of the 'System'
50 factors of VI, AC, RE. The resulting model suggests that these contextual factors of
51 Individual and System had influence on performance and effort expectancy respectively and
52
53
54
55
56
57
58
59
60

1
2
3 with Self-Efficacy (SE) having the strongest influence as an Individual factor and Visibility
4 (VI), Accessibility (AC) and Relevance (RE) influencing the System factor. This suggests
5 that performance expectancy influencing use of GS in the postgraduate context is based on
6 their perception of the visibility, accessibility and relevance of the system, and that effort
7 expectancy also influencing use is based on their perceived self-efficacy. In sum, we might
8 say that this appears to reflect the competency of the postgraduate student as an independent
9 researcher and expressing a preference for the search tool that they perceive themselves as
10 competent to use for the effective search for information relating to their area of study.
11
12
13
14

15 This model of the perception held may be elaborated from a further analysis of the open-
16 ended question included in the survey. This final question asked the respondents for their
17 reason, in their own words, for their preference for Google Scholar as a search tool to use in
18 the context of their study. It should be noted that this question was only included in 10%
19 (n=20) of the total questionnaires distributed as the intention was to provide a check and
20 explore the possibility that further factors may be influence the perception of GS, but were
21 not included in the questionnaire. The responses gathered were analysed to identify the types
22 of reasons given and were coded as Spectrum (31%), Search Facility (30%), Availability
23 (14%), Accessibility (11%), Accuracy (9%) and References (5%). Availability, Accessibility
24 and Accuracy aligned to an extent with the statements in the questionnaire, especially the
25 system features 'Accessibility' and 'Visibility' and provided insight into reasons for the
26 students' preference for using Google Scholar according to these features and in their own
27 words. For example comments coded as pertaining to 'Availability' expressed a preference
28 for Google Scholar, for example '*because it is widespread and known*' and '*because some
29 library resources need to pay to download*'. The comments relating to 'Accessibility'
30 indicated a preference for Google Scholar because it is '*easy and fast to search, without the
31 need to login*'. The reasons given for preference relating to 'Accuracy' were that Google
32 Scholar was reported to be '*[...] efficient*', '*convenient*', and '*precise*'. The largest category
33 coded 'Spectrum' related to statements that mentioned subject coverage for their reason for
34 preferring GS. For example, it was stated *I would use Google Scholar since it has a wide
35 range_of sources in all fields*, and others would seem to agree saying, *I will use Google
36 Scholar because it enables me to get all information [...] I am looking for*, and more
37 specifically explaining that it has *More references and journal articles in my areas of study*.
38 This category 'Spectrum' is interesting as it has the most responses and which align to the
39 statements in the questionnaire in the System Relevance factor, for example '*It has resources
40 that relate to my area of interest*', '*It has enough resources for my study*', and the negative
41 item '*It is limited in its coverage in my area of interest*'. The students in this study appear to
42 hold the belief that they can get everything they need from a search in GS, although a
43 different type of user study would be necessary to understand what happens in practice, for
44 example whilst this perception may influence intention to use, in practice another source may
45 well be queried, such as Web of Science or Scopus. Both Accessibility and Relevance were
46 factors influencing perceived performance expectancy and intention to use. In the
47 participants' own words, a picture of GS is obtained as perceived as widely available and
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 accessible, and as relevant providing access to all the information they might need in their
4 area of study. Finally it is interesting to identify and consider that codes that did not align to a
5 factor in the questionnaire, namely Search Facility and References in providing further
6 insight into the use of GS. Search Facility was the second highest proportion category with
7 comments referring its search facilities, *'Another reason is that there is a citation link at the*
8 *bottom'* and *'Finding key references'*. And to its use for finding citations, for example: *'I*
9 *used Google Scholar in finding the references'*. The specific mention of one of GS features of
10 providing citations is not unique to GS, but is clearly something that the postgraduate student
11 is going to find useful in the course of their research. As is the search feature specifically
12 mentioned in the responses, *'cited by'* which allows the searcher to trace related articles for a
13 published paper. Both mention of citations and the cited by search feature again suggests a
14 competent user who perceives GS as a tool that will enable them to find the information they
15 need and, it might be supposed, a user who is not influenced so much by the social and
16 organisational factors of their peers and the university library.

23 **Implications for research and for practice**

24
25
26 The findings from this study highlight the distinction of the task orientated factors (of
27 perceived performance and effort expectancy) and the social and/or
28 organisational/infrastructure influences and, to the best of our knowledge, no other study has
29 focused on making this distinction and in the context of university student use of Google
30 Scholar. Given that this study focused only on postgraduate students, it would be of further
31 interest to explore these influencing factors amongst undergraduates and with differing levels
32 of subject knowledge and research competency. Furthermore, and from this study, research
33 might usefully investigate the individual context of the student user focusing on the core
34 influencing factors identified here, in particular self-efficacy and perceived system
35 accessibility and relevance. Are these core influencing factors held by undergraduate as well
36 as postgraduate students, and consistently across academic subject domains? Furthermore
37 could the postgraduate's perception of expected performance based on self-efficacy and
38 perceived system accessibility and relevance further explain why social and/or organisational
39 factors may not have an influence in their particular context? The intended aim of this study
40 of postgraduate student user perceptions of Google Scholar was however to provide direct
41 impact with respect to the useful insights it provides librarians and practical implications
42 yielded on how to best promote new information resources to graduate students. Specifically,
43 librarians may want to explore modifications to their university library websites so as to
44 enhance users' perceptions of their usefulness and ease of use. Moreover, usability evaluation
45 of library websites could be undertaken to enhance their acceptance by users. Also, library
46 website designers could work to integrate Google Scholar into the websites as it appears that
47 this would provide a familiar and comfortable interface for users to get acclimatised to the
48 website following which they may be more receptive to investigating the other functions,
49 features, and facilities of these websites. Overall, the perception of performance expectancy
50 of GS and student's self efficacy with regards to its use reflects on the responsibility of the
51
52
53
54
55
56
57
58
59
60

1
2
3 university and academics to continue to teach students, that with some training, the influence
4 they can have on the effectiveness of a search, why they might use different resources and to
5 encourage critical judgement of “when” the results of a search satisfies a need. **Conclusions**
6 **and further research**
7
8

9
10 The study developed and implemented a dimensional questionnaire comprising eleven factors
11 for the purpose of exploring the perceptions determining use of the search tool (Google
12 Scholar) by a homogenous group (international postgraduate students studying in the UK).
13 The analysis of the data collected from the use of the questionnaire has provided insight into
14 the influence of perceived self-efficacy and perceived system accessibility and relevance on
15 the task related performance and effort expectancy influencing use. This approach taken
16 provides a far more detailed picture into the complicated factors that appear to influence use
17 of the tools and services that support students’ study and research. Most importantly it
18 enables understanding to go beyond the assumption that ease of use and convenience are the
19 main drivers behind the decision to use. It is evident from this study that in the postgraduate
20 context and use of a search engine, self-efficacy, (one’s belief in ability to use the search
21 engine to find information) and system relevance, (one’s belief that sought information can
22 be found using the search engine) have an impact on perceived performance and effort
23 expectancy and intention to use. Further research is recommended to explore this beyond the
24 limitations from focusing on the narrow study group of international postgraduate students. A
25 larger and wider groups would enable further exploration of the possible distinct model of the
26 influencing task oriented and social/organisational factors, for example involving students
27 with differing levels of subject knowledge and research competency. For example, given the
28 core influencing factors identified here, in particular self-efficacy and perceived system
29 relevance it is interesting to speculate that the undergraduate student may simply not have the
30 domain knowledge and experience to be confident in making this assessment of performance
31 expectancy of Google Scholar. Evidence of this would warrant the important role of the
32 university library in its provision of reliable and trusted information resources and search
33 tools, as well as in their teaching of critical search skills. Furthermore the rejection of the
34 hypothesis, that contextual factors of social influence and facilitating conditions would
35 influence use, suggests further research of interest, In particular, it would be insightful to
36 investigate these factors as influencing use of systems other than Google Scholar, for
37 example to explore student use of the university library website and for example Web of
38 Science offered from therein. Again such further research could provide insightful indicators
39 of the influence of the library within the university as a ‘social’ and ‘facilitating’ service,
40 serving its user communities and partly driving students’ intention to use A core aim of the
41 university library is to promote and support student use in a range of online libraries and
42 search tools, such measures of impact would further the development of these services. This,
43 and further, research based on user perceptions of the search tools and their use is therefore
44 recommended to yield practical implications on how to best promote new information
45 resources to university students. Questions for the university library such as the design of
