Abstract

This paper explores haptic, affective, sensory and relational interconnections between a child (Erik) and objects, materials and a researcher-practitioner (Christina) at a nursery school in Manchester, United Kingdom (UK). In doing so, it draws upon a Post-humanist theoretical framework. Observational material was collected over the period of a school year. The discussion involves a diffractive three-way ‘thinking together’ conversation between the authors about what emerges as we attempt to listen to Erik’s voices. Improvisation in moments of physical sensation and action with objects, materials and Christina becomes a vehicle for tentative openings and immanent possibilities for all enfolded in the encounter. These are entangled, however, with national and international neoliberal expectations regarding literacy, numeracy and school readiness. We conclude that ‘dissenting from within’ is a necessary ethical practice if we are to offer something more optimistic for children’s becomings than acquiescence in the development of human economic capital.

Key words

Post-humanism; the haptic; thinking together; school readiness; being and becoming
Introduction

This paper stems from a small-scale professional development programme, 2-Curious, developed in response to expanded numbers of government-funded places for two-year-olds. The project began in summer 2014 and ran over seven sessions until January 2016. Participants were six early childhood academics from Manchester Metropolitan University, UK, where the development programme was hosted, and a similar number of practitioners from half a dozen local early years settings. An important part of the project was to encourage participants to trouble dominant beliefs about two-year olds. This troubling was brought about by taking part in the sorts of everyday experiences commonly provided for young children (for example den making, box play) and considering their underlying assumptions. We were interested in ways of knowing beyond the literacy, numeracy and school readiness behaviours which preoccupy the Department for Education (DfE 2017) Early Years Foundation Stage (EYFS). We sought to attend, additionally, to tactile sensations, the haptic, the affective and other aspects of the world that children inhabit. Previous papers by two of the current authors (Barron et al 2017; Barron and Taylor 2017) and by others who took part in the project (Gallagher et al 2017; Holmes et al 2018) provide further information about the development programme.

This paper is concerned with practice in one of the settings, Martenscroft Nursery School and Children’s Centre, which has been committed to finding ways of enabling children to engage with learning experiences that go beyond the preoccupations of the EYFS. The school is faced with the tensions of working within an accountability culture where meeting prescribed requirements is critical to how the school is judged and where, as Roberts-Holmes and Bradbury (2016, 610) note ‘young children could become reduced to the school’s statistical ‘raw materials’ that are mined and exploited for their maximum productivity gains’.

When reviewing the literature, Braidotti’s references (2002) to Middlemarch led Ian to re-read Eliot’s novel (1871-2/1994). Middlemarch is concerned, amongst other things, with notions of
betterment and, critically for this paper, with the place of emotion and the advancement of knowledge. Ian was particularly drawn to Will’s assertion that ‘discernment is but a hand playing with finely ordered variety on the chords of emotion … knowledge passes instantaneously into feeling, and feeling flashes back as a new organ of knowledge’ (Eliot 1871-2/1994, 207). In relation to our interests in this paper, we might think of how knowledge guides the touch of the physical hand, giving rise to sounds that stir a variety of emotions which in turn create new ways of knowing. Feeling and knowledge then spring back as subtle changes to the way in which the fingers play the chords in an enfoldiing, intra-active, iterative and unknowable process. This finds resonance with our interest in the idea that reason is entwined with the material, haptic and affective in how young children experience and create their worlds.

The paper draws upon a Post-humanist/New Materialist theoretical framework, seeking to explore children’s learning beyond the usual emphasis on cognitive learning. We seek to explore what Lawrence (2019, 319) calls ‘the potential of relation with …. materials, objects and the environment’ as young children weave in and out of different kinds of interactions. Drawing on Post-humanism’s decentring of the human as the reference point for all existence and knowledge, we recognise human interconnectedness with objects, materials, other living creatures, plants and all forms of matter in a complex and interconnected universe. This entanglement has generally been neglected in favour of a preoccupation with human reason and mastery. We seek to work with the understanding that ‘discursive practices are on-going agential intra-actions of the world through which determinacy is enacted within the phenomena produced’ (Barad, 2007, 335) and that ‘intelligibility is not an inherent characteristic of humans but a feature of the world in its differential becoming’ (2007, 335). In other words, what we can know and understand is a result of the entanglement of human beings with all other forms of matter and how this intra-action shapes events and behaviours. Foucault (2002a), however,
shows how the discursive-material regulatory practices of the neoliberal state operate to value a very narrow range of responses and place very heavy constraints upon practitioners’ actions. Our interest is in whether spaces can still be found to keep possibilities and responses open.

Neoliberal caring about young children

Over the past 20 years, in the UK and internationally, there has been considerable concern about early childhood experience, which has resulted in the allocation of additional public funds in several countries. This reflects attention to claims from neuroscience (see, for example, Shonkoff and Phillips 2000, Gopnik et al 2001), that ‘impoverished’ early experiences cause inadequate synapse development, with lifelong consequences. Thus, for the first time in the UK, guidance was commissioned to support practitioners working with children from birth to three. Ian was a member of the project team that produced this guidance for the Department for Education and Skills (DfES 2003). The financial crisis of 2008, and the defeat of the New Labour government in the 2010 UK elections, led to austerity measures under the Conservative-led coalition. Spending on provision for young children and their families has been reduced considerably over the past decade. Public investment now centres on those seen to be at risk because of disadvantage. While the UK focus of the paper is recognised, the developments discussed have resonance across the Global North and have become UNESCO and World Bank priorities for the Global South (Marope and Kaga 2015).

Many in the early childhood sector welcome the government focus on young children, following a century of marginalisation. Birth to Three Matters (DfES 2003) emphasised the capabilities of young children as ‘Competent Learners’ and the accompanying video opened with the statement ‘young children are amazing’. Lewis (2018, 2) points out that whilst this view of children’s competence, uniqueness and rights still existed in the 2017 revision of the EYFS (DfE 2017), it ‘offers no exemplification of how this principle might be translated into
practice’. Whilst the EYFS (DfE 2017, 5) states that ‘a secure, safe and happy childhood is important in its own right’, children are considered primarily in terms of deficiencies in their early experiences and the focus is ‘school readiness’ to ensure that they have ‘the right foundation for good future progress through school and life’ (DfE 2017: 5). Drawing on Cross (2011), Kingdon (2018) highlights the temporal state of ‘having been’ whereby ‘children in both their current state of being as well as their future state of becoming are influenced by what has already occurred’ (356). Thus, the emphasis is on whether what has already been enables children to conform to what schools expect of them (they are ‘school ready’), especially in terms of literacy, numeracy and the ability to listen attentively. These are viewed as the basis for what will come later. Thus, as Stirrup et al (2017, 357) note, ‘practice emphasises a performance pedagogy …. which allows children to demonstrate predetermined knowledge and skill against explicit criteria’. Kinkead-Clark’s argument (2018, 11) that ‘the perception that readiness only resides within children ignores the school’s responsibility in this regard’ is one with which many in the early childhood sector would agree but it does not find much support in policy documents.

This investment in compensating for perceived inadequate early experiences in families experiencing disadvantage reflects Heckman’s human capital theory (see, for example, Garcia et al 2017). The argument is that costs

‘will be outweighed by children’s increased earnings in adulthood and the contribution that they will make to the economy …… Therefore, effective or high-quality provision is intended to provide a good return on the initial financial investment and the earlier that children meet expected outcomes the better’ (Lewis 2018, 4).
The proposed revised expectations for what children should achieve by the end of the EYFS (DfE 2019) reflect downward pressure from expectations in the primary school years. Expected achievement levels in literacy and numeracy have been increased in these, the only areas of the EYFS where significant numbers are not currently achieving expectations. Whilst Lewis (2018, 6) talks of the ‘unintended consequences’ of this focus, many would argue that these are not unintended consequences at all but rather power operating, in Foucauldian terms (2002a), to discipline and compensate for those deemed deviant and/or inadequate (Foucault 2002b).

Methodological approach

In seeking to continue the close collaboration that had developed as part of 2-Curious, the three authors were interested in exploring the space for sensory and haptic experience at Martenscroft Nursery School and Children’s Centre. We were also curious about the scope for these experiences as they bumped against the kinds of regulatory tensions highlighted above. In Autumn 2017, Christina began a three-year research residence attached to Martenscroft Nursery School and Children’s Centre in order to undertake a longitudinal study of its first government-funded group of two-year-olds. Ian visited the nursery school in July 2017, at the beginning and end of the Autumn of 2018, and during Spring 2019, in order to observe the children as they interacted with practitioners and the nursery school environment. The intention was that these observations would form the basis for this paper.

In writing the paper, Ian, Lisa and Christina brought different histories with them. Ian was a university head of department at the time of the project, had an existing relationship with Martenscroft before 2-Curious but took part in only a small number of the professional development sessions whilst having a significant role in writing the project papers. Lisa was the deputy and is now the head teacher at Martenscroft, attended almost all the development
sessions, kept a research journal and has contributed to the writing of this and previous papers. Christina was a nursery teacher in a different part of Northern England and so did not attend the sessions but is now a Manchester Metropolitan University research fellow, employed specifically in order to carry out the longitudinal study.

The paper uses the actual names of the university, academics, practitioners and the nursery school, reflecting the onto-epistemological and ethical stance that regards existence (ontology) and what we can know (epistemology) as being inseparable from the people, context and means by which we seek to determine what is happening in any given situation. Thus, the university, academics, nursery school practitioners, children and their families, and the nursery school and its location are what give meaning and shape to what we can know about the children’s experiences and ways of understanding and about the practitioners’ pedagogy. This stance reflects a New Materialist position and Barad’s notion (2007) of the importance of the ‘apparatus’ and ‘agential cut’. Drawing on quantum physics, Barad (2007) argues that behaviour and properties are situational rather than absolute and the result of the particular apparatus (people, other materials and objects) that shape behaviour in a particular situation. Facts, behaviours and knowledge are always fashioned by the particular ‘agential cut’ created by the interplay of distinct factors in specific situations. Anonymisation would be at odds with this stance. Ethically, we have, however, felt it important to anonymise the children, given that even if their parents and/or the children themselves agreed to the use of their real names in the present, publications are available for many years and the children may feel differently as adults.

Feedback on previous conference and journal papers suggested that attention to children’s responses was a significant omission. This is not surprising since 2-Curious had been about academics’ and practitioners’ responses to materials and had not involved children. This paper, however, draws on children’s voices in data collected from September 2017 until July 2018.
As Wall et al argue (2019, 268) ‘any definition of voice will be, by necessity, broader and more inclusive of a greater range of communication strategies beyond words and cannot exclude behaviour, actions, pauses in action, silences, body language, glances, movement, and artistic expression’. Drawing on the Mosaic Approach (Clark 2017), we attended to visual, haptic and bodily voices as well as auditory ones. This has involved careful attention to the children’s gestures and physical responses as they engage with their learning environment to help us better understand their preferences and ways of knowing. We focus on detailed consideration of the play of one these children, Erik, with Christina, in order that we can explore this complexity in depth, which would not have been possible had we included a broader range of observations.

The whole notion of observation has required careful thought because of its shaping and disciplinary nature. Hoskins and Smedley (2019, 84) highlight that their study of EYFS practice ‘revealed discourses that had become inscribed by a performative and academic agenda and culture, a context where practices are highly regulatory and where what constitutes success for our settings can be viewed as driven by outcomes’. Christina pointed to similar dilemmas facing practitioners at Martenscroft and noted that their practice is likely to be shaped by the regulatory framework and the way in which it exercises power to determine what is considered important. Thus, in discussion with Christina, Ian and Lisa came to realise that our ethical care for the practitioners made it difficult to study their interactions with the children in the way that we initially intended, as observation, as a material-discursive practice, would have placed further pressure on them.

The paper is, therefore, based primarily on an observation undertaken by Christina. As researcher-in-residence with no responsibility for the children’s learning and progress towards the expectations set out in the EYFS (DfE 2017), practice possibilities are open to Christina that are much more difficult for the school’s practitioners to access.
Discussion of the play sequence involved a three-way conversation between Ian, Lisa and Christina. There is no sense of our research having been undertaken to establish truths or facts. Thus, our concern is not with triangulation in the traditional sense that looking from different perspectives somehow allows claims to be made for the greater veracity of what happened or for a particular interpretation. Our concern is with ‘reading insights through one another in ways that help illuminate differences as they emerge’ (Barad 2007, 30) creating thickness of understanding where seemingly contradictory elements can sit alongside each other, creating other possibilities.

The paper conceptualises the ‘agential cut’ (Barad 2007) created by the enfolding of Erik, Christina and objects and materials in the nursery environment as the onto-epistemological basis for events and behaviours. The events and behaviours are further entangled by and with the three-way conversation between Ian, Lisa and Christina. The decision to focus on one out of the many observations and hours of video recording that Christina undertook is intended to enable detailed consideration of the immanent possibilities in every moment of Erik’s play and also of how these are shaped by material-discursive practices. It allows us to consider the decisions that practitioners address as they observe, involve themselves in, and intervene in children’s play and how this shapes possibilities and determinacies.
**Findings: listening to the voices of children**

Christina’s observation is presented in three parts to enable the reader to more readily recall it in reading the discussion.

**Observation Part A**

Erik is playing with the water – filling scoops and throwing them across the water tray – when I join him by sitting nearby on my knees, he throws a scoop in my direction and my trousers get wet – I show him my wet trousers and ask him to be careful as I don’t want to get wet, but a few moments later I am soaked again, this time by a small plastic bucket. Erik is beaming, and I explain again that I don’t like getting wet.

**Ian, Lisa and Christina in Discussion (Part A)**

Christina noted that although she was interested in what the water afforded Erik, she did not enjoy getting wet and so her initial concern was simply to make him stop splashing her, demonstrating the way in which the human, sensory and material (in this case liquid) bump against each other and determine what is enacted. She felt that her former practitioner identity may also have been in play, with her knowledge of the EYFS’s expectation that children show sensitivity to others’ needs and feelings, form positive relationships with adults, know that some behaviour is unacceptable and follow instructions. Erik did not stop splashing Christina, however, and she notes that he was beaming. Perhaps his enjoyment of the sensory experience of being wet means that he is so engrossed that this dominates any concern for Christina as another human being. Perhaps he also likes having Christina there with him and so throws the scoop as a way, misguided from Christina’s perspective, of keeping her there. Christina thought she had interpreted the beam not as uncaring delight in her getting wet but as enjoyment of her reaction. It might also be that he was testing Christina’s reactions, perhaps checking whether, if he kept splashing her, he would get the same response or whether she would come around to
his way of thinking. Questioning motivation in this way perhaps reflects a tendency to assume that behaviours are necessarily based in thought but it also opens up the possibility that several things might have been at play (Deleuze and Guattari’s ‘and … and then,’ 1983, 5) in the entanglement with objects, sensations and human beings. It also allows consideration of the complexities of engaging with different aspects of the voices of very young children and the decisions faced by practitioners in determining their responses.

Observation Part B

I have noticed he has started to look at the water coming through the hole at the bottom of a bucket and I start to put my finger in the wooden hole in the shelf across the water tray. He looks interested in my actions, so I start to pour water out of the bucket through the hole in the buckets and aim it so the water runs through the hole in the shelf. Erik is very engaged – laughing as I pour and, if I do not repeat, he vocalises loudly until I respond.

Ian, Lisa and Christina in Discussion (Part B)

Our attention then focused on the point where Christina noticed that he lifted the bucket up and her extemporised response. Christina thought he became interested in where the water was coming out and, at this point, he paused, gazing at the hole. She noted that she may have felt some of the responsibility that a practitioner might feel for trying to make his play ‘more purposeful’ (by focusing on the flow of water through holes) and for attending to the EYFS’ concern (DfE 2017) for ideas such as position, solving problems, exploring the characteristics of everyday objects. This interaction of researcher–practitioner in her identity illustrates the challenges of how to approach development work with practitioners, who would be likely to be even more affected by regulatory requirements.
Christina thought it more likely, however, that the hole became a way to improvise, a point of playful connection, of tentative opening of immanent possibilities. She responds to his perceived interest through actions rather than words, reflecting how her interactional style had changed over the past year as she had gained more experience of working with two-year-olds. She felt that consciously and unconsciously, she had become experimental, changing from more observational and linguistic approaches, to ones where she tried not to use words where language was not children’s dominant form of communication.

Erik’s laughter is a significant voice to hear in response to Christina’s actions. Christina’s actions and Erik’s laughter at the flow of water through the hole affirmed a connection between them that did not require words, but which was based in communicative playfulness, leaving a space open for immanent possibilities. All three of us sensed that actions, laughter and vocalisation were significant voices for Erik, used to bind him together with Christina and the materials, and to elicit repetition and enjoyment.

Observation Part C

To experiment, I throw a stone from the nearby display in the bucket and then rotate the bucket in my hand so that the stone whizzes round the rim .... and Erik is engaged and then pulls the stone out and offers it back to me. We play like this for a while with the stone going back and forth between us and also being shaken inside the bucket and making an interesting sound.

Ian, Lisa and Christina in Discussion (Part C)

We were all intrigued by the point where the focus became the stone whizzing round the bucket. Christina seeks ‘to experiment’ in the observation, clarifying that what she meant was trying to develop a more improvisatory practice. We discussed Christina’s repeated attempts to feed his interest through actions, rather than words and how action seemed to be critical to his
engagement. Christina noted how she read Erik’s offering of the stone as a communicative act, one of his voices, suggesting interest in the stone as object but an interest that, through the act, he was sharing with another human being. Therefore, she felt a need to reciprocate and sustain it. Offering the stone suggests a generosity and a sharing and delighting in Christina’s actions and the movement of the objects and materials as a shared endeavour. It seems to be less that he thinks he cannot do it himself and more that he is revelling in what he is watching and so does not want it to stop. Erik returning the stone to Christina suggests a sort of care and support, possibly in response to what she is doing for him. Perhaps there is a sense of mattering to each other, of care as a ‘speculative … intervention in what things could be’ (Bellacasa 2017, 66) as important aspects of what opens possibilities and sustains the play.

We noted that Erik seems largely to be watching whilst play is usually considered to involve action. Perhaps what he is finding so enjoyable is watching the movement and action as a shared endeavour with Christina. Lisa identified a sense of him directing what is happening without being involved in the doing. In this sense, he is leading the play and the sound of the stone whizzing round the bucket has become something that he laughs at or responds to in some way. Whilst adult interactions with children very often cut short what matters to the children, Christina and Erik engage in play that seems to involve ‘holding open the possibility that surprises are in store, that something interesting is about to happen…. and … changes everybody in unforeseeable ways’. (Haraway 2016, 127). Seeking to explore possibilities in this way ‘demands the ability ….. to cultivate the wild virtue of curiosity, to retune one’s ability to sense and respond ….’ (Haraway 2016, 127).

**Caring about young children in a post human world**

Christina’s interactions with Erik strike us as grapplings with what it means to listen to children’s voices and become entangled with children in their Posthuman becomings. Whilst
acknowledging the devaluing of young children inherent in neoliberalist agendas and how they conceive of becoming (see, for example, Hayes and Filipović 2018), we wish to rehabilitate the notion of ‘becoming’ in early childhood. For us, what children possess now in the present, in their being, involves their potential for the future, for what they will become. It involves ‘a dynamic intra-active becoming that is implicated and enfolded in its iterative becoming’ (Barad 2007, 151, original italics). The inter-relationship is one of ‘becoming-with, not becoming ... Ontologically, heterogeneous partners become who and what they are in relational material-semiotic worlding’ (Haraway, 2016, 12-13). Thus, both Erik and Christina are enfolded in the becoming.

Being and becoming are not different states and not separated in time. There is no ‘moving beyond, no leaving the ‘old’ behind. There is no absolute boundary between here-now and there-then’ (Barad 2014, 168). Whilst becoming is anticipatory, it is concerned with possibility rather than predetermined notions of what must come later. It does its work in the present and connects with the past, ‘activating powerful motivating forces’ (Braidotti 2011, 90) that create possibilities. Massumi (1992, 102) offers the optimism that ‘becoming is an escape … the body-in-becoming does not simply react to a set of constraints. Instead, it develops a new sensitivity to them, one subtle enough to convert them into opportunities.’ It is this notion of becoming we see as at the very heart of an optimistic and immanent encounter between children, materials, objects and practitioners in entangled practices (what Barad, 2007, calls ‘intra-action’) of making meaning together and with the environment in which they find themselves. Following Braidotti (2002,18), the immanent encounter is ‘a founding, primary, vital, necessary, and therefore original desire to become’. Rather than being wholly concerned with the development of human capital, becoming gives rise to creative possibilities that are concerned with more than economic, political, social and economic productivity in service of
a neoliberal state, making space for the prospect of a richer and more ethical life for both children and practitioners.

**Discussion: thinking together**

In thinking together, we value the ways in which our different positions combine, overlap and bump against each other, thereby shaping and bending what emerges. Barad (2007) refers to this process as diffraction, drawing on the behaviour of waves when they meet an obstacle. Lisa is a head teacher and practitioner, which necessarily gives meaning to how she perceives the practice and learning for which she is accountable, but she was not necessarily present at the time of the observation. Christina had until recently been a practitioner but her new position as researcher-in-residence could be seen as giving her the most direct access to the events and their meanings. This, however, would suggest that the observational material can capture some form of objective truth about ‘what happened’, when we understand this as being created between everyone and everything entangled in the play. However, we are working with notions of the past as ‘always open’ (Barad 2014, 181) as understandings about it are the result of the agential cut (Barad, 2007), the means by which it is perceived. In carrying out the observation, the agential cut is fashioned by Christina from what happened in her entanglement with the children and the nursery school environment, the objects and materials, and the practitioners but its meanings remain open (Barad 2014) and are further shaped by the discussions between Ian, Lisa and Christina.

Ian’s hegemonic position, as male, white, the lead author and the most senior academically, is potentially exploitative whilst also providing little access to the oppressed/‘minoritarian’ (Deleuze and Guattari 2004) experiences of the children. Ian was, however, for many years, an early childhood teacher, a field in which men are the minority. This, perhaps, has provided him with some experience of, or requirement to, engage with what it means to be part of a
minority group. Whilst he feels himself committed to a process ‘that rends him from his major
identity’ (Deleuze and Guattari 2004, 321), depressingly, Braidotti (2011) asks

‘I wonder what it is that makes them want to embark on this sudden
programme of dephallicization … what do these new male hysterics want.
I see nothing more in this manoeuvre .. (than)… a desire to carry on the
hegemonic tradition’ (268-269).

If Ian’s commitment to understanding the perspective of others is considered a cynical
manoeuvre, it is at least part of a thinking-with Lisa and Christina about the material, relational
and intra-active entanglement of Christina, Erik, materials, objects and discourses. Thus,
thinking-with is seen as making ‘the work of thought stronger, it supports its singularity and
its contagion … It builds relation and community, that is, ‘possibility’’ (Bellacasa 2012, 203).
Thus, the diffractions involved are viewed as generative and offering a thickness of
understanding of Erik’s voices and Christina’s responses. The three perspectives are entangled
in a textured and viscous ‘thinking with’ and ‘thinking together’ about the children’s beings
and becomings in interaction with objects, materials and Christina.

Reviewing the possibilities, constraints and dilemmas of post-humanist becoming

So, reflecting on the observation and our discussion, what of our interest in how 2-Curious has
entwined itself in the spaces and practices of the nursery school and the learning, development,
being and becoming of two-year-olds? Where has our interest taken us and what have we learnt
as we have sought to research these concerns? A significant issue to emerge has been the need
for a major shift in research practices. Barad highlights ‘to the degree that … observational
inventions …. have a role to play, they do so as part of the material configuration of the world
in its intra-active becoming’ (2007, 341). Christina has come to struggle with the whole notion
of observation on a number of counts, including the way in which it is a material–discursive
practice that shapes and disciplines what is seen as mattering. The concern has a further philosophical aspect, regarding the idea of trying to put into words what you did and why you did it. She felt that at each moment so much might be happening, and this is totally impossible to capture. She also felt that words were simply inadequate as they bring a fixity, which makes the whole event seem teleological, as though things were always going to unfold that way. This rather disregards affective and haptic aspects of practice and rather supposes that the world is a logical place. Observation, like scientific rationalism, loses the sense that ‘each moment is alive with different possibilities for the world’s becoming and different re-configurings of what may yet be possible’ (Barad 2007, 182).

The second concern about observation was more ethical in nature. We came to realise that our ethical care for the practitioners made it difficult to study the interactions of children, practitioners and the nursery school environment in the way that we initially intended. What we did find, however, was that Christina’s role as researcher-practitioner, rather than that of teacher, subject to accountability measures for the children’s progress and development, offered a means to create a more experimental space to explore possibilities for learning and pedagogy beyond the preoccupations of the EYFS (DfE 2017). Christina’s different positioning has allowed us to explore ‘the emergent, the creative, the intra-active encounters (children) engage in as they do the ongoing work of bringing themselves and their community into being’ (Davies, 2014, 15). What it has not necessarily done, however, is to enable us to consider how this plays out for practitioners at Martenscroft Nursery School and Children’s Centre, as we originally intended, though we do get some indications because of Christina’s practitioner-researcher identity. We intend to explore this further in professional development work with practitioners. We need to think about how we do this in ways that are in keeping with our Post-humanist framework.
And what of our interest in Will’s contention in Middlemarch that ‘discernment is but a hand playing with finely ordered variety on the chords of emotion - .. knowledge passes instantaneously into feeling, and feeling flashes back as a new organ of knowledge’ (Eliot 1871-2/1994, 209). This understanding of discernment seemed to be at the heart of Erik’s haptic, sensory, communicative and relational encounters and entanglements with objects, materials and Christina in a process of becoming, even if the form that it took was more dance than music.

These are important and complex matters for practitioners to explore, as they point to the possibility of something more optimistic than preparing children as future human capital. As Braidotti (2013, 93) argues ‘we need to become the sorts of subjects who actively desire …. mutant values and to draw our pleasure from that, not from the perpetuation of familiar regimes’. These are not matters, however, that feature in any readily identifiable way in the English EYFS (DfE 2017).
Nonetheless, despite the challenges it brings, Lisa is particularly drawn and committed to Braidotti’s proposal (2002, 262) ‘that we do not rush forward to hasty resolutions of complexities we hardly can account for. Let us instead linger a little longer within complexities and paradoxes, resisting the fear of immanent catastrophe’. She cannot, however, readily escape the requirement to ensure success in terms of what matters to neoliberalism.

Whilst finalising this paper, Ian presented a version of it to colleagues at his own institution. One colleague suggested practitioners should refuse to negotiate with the requirements of regulatory frameworks and agencies where they believe it is not in the best interests of children and where it is the requirements that need to change. In a similar vein, Arndt and Tesar (2016, 22) highlight Havel’s argument that ‘when human subjects .... support .. the governing ideology, their actions become part of the actants that shape the structures which constitute the system’ and no doubt also perpetuate rather than change it. Christina commented that she felt that refusal is extremely difficult for a state-maintained nursery school since state provision, as non-statutory, is continually under existential threat and government (Ofsted) inspection outcomes are often seen as mattering to their survival. Indeed Robson and Martin (2019, 95) note ‘the tension between advocating for the interests of children and families and navigating an environment of marketisation of the ECE sector and corporatisation of ECE provision’.

There is also the ethical concern about what would happen to the children if a particular setting dispensed with the statutory requirements.

As researchers, all too often we offer challenges to practitioners that demonstrate an insufficient ethic of care towards those carrying so much responsibility. Negotiating these intricacies may result in ‘affective and material burnout’ (Bellacasa 2017, 163). A path must be woven that ‘involves complex and continuous negotiations with dominant forms and values and hence also multiple forms of accountability’ (Braidotti 2013, 35). Casting a long shadow over the very real desire to attend ‘to a ray of light on water, for example, a tree glowing green...
in the late afternoon light, a breeze, the sound of laughter’ (Davies, 2014,10), is an accountability culture whose agential cuts ‘account’ primarily for cognitive and scientific ways of understanding and, in the measuring, makes these what matter. As Haraway (2016, 12) says ‘it matters what matters we use to think other matters with; it matters what stories we tell to tell other stories with; it matters what knots knot knots, what thoughts think thoughts, what descriptions describe descriptions, what ties tie ties’. It matters what we decide matters.

Lisa feels very keenly that it matters to the parents and staff that the school retains an Ofsted outstanding rating as this agential cut determines how the progress and achievement of the children are judged and what future possibilities are available to them. Indeed, Neaum (2016, 243) highlights that ‘the significance of Ofsted’s assessment of school readiness cannot be underestimated. Its uniquely powerful position to influence policy, and enforce change through regimes of inspection, places them at the centre of the creation and maintenance of the dominant discourse’. At the same time, following Press et al (2018, 377), Lisa is concerned to ‘situate ECEC within the context of a society that it is worth living in, to move beyond the atomisation and individualisation of benefit, success and achievement’.

Venturing beyond what is measured as mattering requires the ability to read through each other these different perspectives on what matters in becoming and to withstand the dissonance. Thus, alongside Lisa’s responsibility for the children’s success in terms of the EYFS (DfE 2017), she is also committed to providing a space in which alternative material-discursive practices form other and more ethical versions of reality; ones that ensure that the children are able to hear ‘the grass grow and the squirrel’s heart beat’ and to ‘hear the roar which lies on the other side of silence’ (Eliot 1871-2/1994, 226). These commitments are also apparent in Christina’s interactions with Erik. Lisa hopes to ensure that the aspects of learning that policy does not privilege as mattering are not neglected in practice, as to do so would be detrimental to the children who matter to her and would foreclose possibilities for them. It is a form of
‘dissenting within’ as a means of ‘thinking with care’ (Bellacasa 2012, 207). It is the difficult diffractive path to finding ways of enabling the children and staff to be successful in relation to the various formal measures whilst working the spaces of entanglement in the creative immanence of the other matterings that offer something more optimistic for children than the seductive ensnarement of neoliberalism’s preoccupation with children only as human economic capital.
Acknowledgements

We would like to thank Rachel Holmes for her comments on an earlier version of this paper.

Declaration of interest statement

The authors have no conflicts of interest to declare.

Funding details

2-Curious and Christina’s time were resourced from the university’s strategic opportunities fund through a competitive bidding process. Their respective employers funded Ian and Lisa’s time.
