## Problematising Philosophical Assumptions in EE's Invisible College

### Abstract

**Purpose:** This paper seeks to energise discussion around philosophical assumptions in Entrepreneurship Education (EE). Far from being abstract considerations, this paper underscores that philosophical assumptions – which are embodied in research products, and inherited from others - have practical implications.

**Study design/methodology/approach:** Our approach is to purposefully unsettle taken for granted assumptions implicit within 44 influential articles which have been said to reveal EE's Invisible College. We utilise three heuristic tools offered by problematisation - identifying paradigmatic assumptions, (re)conceptualizing subject matter and making a reversal – to explore the implications of the meta-theoretical underpinnings of this body of work. The goal of this paper is not to find a definitive answer to the question 'what is EE's underlying philosophy?' but rather asks 'what can we learn about philosophical assumptions by reconsidering this particular set of influential articles at a deep level?'

**Findings:** With some notable expectations, EE's Invisible College is a place where ideas about an external social reality accessible to the dispassionate researcher are implicitly accepted, where assumptions about the possibility of objective knowledge and the superiority of scientific methodology dominate and where functionalist research products reproduce the social status quo. Thus, whilst the EE research studied might appear diverse at a surface level (topics, research design, inter-disciplinary perspective), diversity is less apparent when considering the deeper, philosophical assumptions which underpin this body of work.

**Originality/value:** Revealing assumptions which are embodied within research products may prompt critical thinking about the practical implications of research philosophies in the field of EE. In considering the implications of philosophical assumptions, a connection is made between problems that are observed at surface level - from lack of legitimacy, criticality and taken for grantedness of the field - to the deeper *hidden system of ideas* which lies beneath. Having highlighted potential problems of these deeper assumptions, the paper concludes by posing questions in relation to *the type of research* that is pursued and legitimised in the field of EE, the *socialisation of researchers* and the implications for *criticality* in the field. Such issues illustrate that, far from philosophical assumptions being an abstract or unimportant concern, they are highly practical and have the power to constrain or empower action and the social impact of research.

**Key Words:** Entrepreneurship Education, Invisible College, Philosophy, Problematisation.

## Problematizing Philosophical Assumptions in EE's 'Invisible College'

### Introduction

Entrepreneurship Education (EE) is said to be at a crossroads (Loi *et al.*, 2021). Policy makers, educators and individuals have been persuaded of its value and courses and programmes have proliferated exponentially; yet EE itself, as an academic field, is said to have limited legitimacy (Loi *et al.*, 2021; Fayolle *et al.*, 2016). Indeed, EE may even be “a victim” of its broad and rapid success if its assumptions and intentions are not debated, and therefore sound more like power and ideology (Loi *et al.*, 2021, p. 9). Questions over the relevance, coherence, appropriateness and social usefulness of EE have been asked for some time (Fayolle, 2013), with a lack of criticality and unquestioning reproduction of taken for granted practice and assumptions limiting its legitimacy (Berglund and Verduijn, 2018). In this conversation about the legitimacy of EE, the state of entrepreneurship *education* is contrasted with that of *entrepreneurship*, which is said to have a more advanced level of scholarship (Neergaard *et al.*, 2017; Neck and Corbett, 2018). Entrepreneurship has been called the ‘mother field’ or ‘primary field’ from which entrepreneurship education derives and therefore it is useful to compare scholarly development between the two fields (Thrane *et al.*, 2016). One important development in entrepreneurship scholarship is the increasing attention paid towards issues of philosophy in research, with successive authors articulating the importance of underlying assumptions in scholarly material (Pittaway, 2005; Alvarez and Barney, 2010; Pittaway and Tunstall, 2015; Packard, 2017; Ramoglou and Tsang, 2017; Garud *et al.*, 2018; Munoz and Kimmitt, 2018). These authors illustrate that research products embody assumptions regarding some view of the world, some view of knowledge, some assumptions about human behaviour and the nature of society. These assumptions, it is argued, *are implicit within* the research products that are created, even when they are not *explicitly* articulated. Exploring these assumptions is considered important work which will develop the legitimacy of the field and

1  
2  
3 the criticality of scholars (Fayolle *et al.*, 2016), and which should involve challenging taken  
4 for granted assumptions and unsettling dominant perspectives and uncontested truths  
5  
6  
7  
8 (Berglund, Hytti and Verduijn, 2020).  
9

10  
11  
12 In entrepreneurship *education*, writing about philosophy has tended towards being concerned  
13 with its relationship to educational practice. For example, describing the importance of  
14 ontological and epistemological underpinnings regarding a world view of EE (Gibb, 2002); the  
15 need for educators to reflect upon the philosophical underpinnings of their practice (Hannon,  
16 2005), critiquing the 'old' capitalist philosophy of EE practice (Rae, 2010), and, more recently,  
17 comparing the epistemic stances of EE courses (Bhatia and Levina, 2020). A greater  
18 consideration of philosophy in EE has been identified as a means of promoting and developing  
19 more ethical practitioners and critical thinkers (Berglund and Verduijn, 2018). It has been  
20 noted that philosophies implicit within EE *research* is a neglected area, with a lack of clarity  
21 and exploration regarding ontological and epistemological dimensions limiting the legitimacy  
22 of the field and more critical stances needed to advance and unsettle thinking (Fayolle *et al.*,  
23 2016; Neergaard *et al.*, 2017; Berglund, Hytti and Verduijn, 2020).

39  
40  
41

42 The focus of this article is to surface and question philosophical assumptions in EE research in  
43 order that EE researchers have an opportunity to (re)consider what problems might exist with  
44 these assumptions and how the research community might seek to resolve them.  
45  
46  
47

48 To do this we utilise some of the resources offered by problematisation (Abbott, 2004;  
49 Alvesson and Sandberg, 2013), an approach which aims to make explicit taken for granted  
50 assumptions in existing literature or a *body of work*. This approach is different from a  
51 thematic, integrative or even a critical review as it involves *going beyond* concerns about  
52 definitions, concepts and/or the content of research (Alvesson and Sandberg, 2013; Alvesson  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 and Sandberg, 2020). Such conceptual and definitional labels often have “no clear or absolute  
4  
5 boundaries” and have an ‘endless variation’ in their usage (Alvesson and Sandberg, 2020, p.  
6  
7 1292). Indeed, privileging “hegemonic ambiguous big concepts” is discussed as a problem  
8  
9 with regular review approaches as it forces researchers to position themselves within a  
10  
11 particular knowledge domain, camouflage confusion and promote sameness (Alvesson and  
12  
13 Sandberg, 2020, pp. 1292 - 1293). Problematisation rather tries to go beyond the focus on  
14  
15 “labels” and the “analytics of the surface material” (Alvesson and Sandberg, 2020, p. 1300),  
16  
17 and instead aims to consider the “very pre-suppositions” that are made within research  
18  
19 products, that is the *ontological*, *epistemological* and *sociological* assumptions which  
20  
21 underlie specific literature (Alvesson and Sandberg, 2013, p. 52).  
22  
23  
24  
25  
26

27 Problematisation is also described as being rooted in the habit of questioning generalisations  
28  
29 and background assumptions, and asking “is this really true...or could I get somewhere  
30  
31 regarding this as a problem rather than as something taken for granted?” (Abbott, 2004, p. 126).  
32  
33 The approach offers a number of heuristic tools through which problematisation can be  
34  
35 developed; however, the broad thrust of the process is to *deliberately* identify and challenge  
36  
37 assumptions and unsettle what is already ‘known’ around a subject by (re)considering  
38  
39 assumptions in literature (Alvesson and Sandberg, 2013, 2020). The purpose of adopting a  
40  
41 problematisation approach in this article is not to be purposefully counter-intuitive in the hope  
42  
43 of being interesting (Tsang, 2021), but rather to explore phenomena which may be taken for  
44  
45 granted in the sense of being unexplored (Quattronne and Hopper, 2001). Before we introduce  
46  
47 the body of work which was the focus for this problematisation, we elaborate the approach to  
48  
49 inquiry to orient the reader as to how the paper unfolds.

### **Problematism as an approach to inquiry**

*Problematism methodology* encourages researchers to identify and challenge implicit but routinely taken-for-granted assumptions within a body of literature. It is an alternative to gap-spotting or gap-filling, which often builds on or around existing literature rather than identifying and challenging foundational assumptions (Alvesson and Sandberg, 2013, 2020). The ultimate aim of problematisation is to generate questions which will open up and unsettle what we already 'know' around a subject (Alvesson and Sandberg, 2013, p. 13). Whilst a number of methodological steps have been elaborated to support the process of identifying and challenging assumptions in literature (Alvesson and Sandberg, 2013), problematisation is also described as an organic and adaptive approach to inquiry, with principles to be applied creatively to support specific research goals (Alvesson and Sandberg, 2020).

The development of the arguments presented in this paper evolved over a number of stages. In the first place, the first author of this paper conducted a review of the articles identified as belonging to EE's 'Invisible College' (the detail of this is discussed further in following sections). Following this, the product of this review - a matrix of ontological, epistemological and sociological assumptions (Appendix A) - was used as a focus for problematisation (Alvesson and Sandberg, 2013), developed and articulated by both authors. Specifically, three heuristic tools offered by problematisation are utilised in this paper - identifying paradigmatic assumptions, (re)conceptualizing subject matter and making a reversal – to explore and articulate the implications of the meta-theoretical underpinnings in the chosen body of work. Together, and prior to this paper, the authors presented a discussion of the methodological aspects of problematisation (Authors, 2018), and then refined and rehearsed the arguments which resulted from that process (Authors, 2019). Thus, the iterative advancement of this article via two conference papers and the journal review process underscores the role of ones'

1  
2  
3 research community of practice in questioning and developing research products (Tavory and  
4 Timmermans, 2014) and the role drafting and writing (Menary, 2007), has played in the  
5  
6 crafting of empirical material which aims to open up assumptions for problematisation  
7  
8  
9  
10 (Alvesson and Sandberg, 2013).

11  
12 This paper unfolds in the following steps. First we introduce the notion of a problematising  
13 review and identify a domain of literature for assumption challenging - EE's 'Invisible College'  
14 – a body of work including many highly cited EE texts which continue to be referenced today.  
15  
16 Then we describe what makes a paradigmatic assumption and elaborate the process of  
17  
18 *identifying paradigmatic assumptions* (Alvesson and Sandberg, 2013, 2020), within the  
19  
20 research products reviewed. Critical insights gained into the body of work studied are  
21  
22 presented, then the problematising heuristic of *(re)conceptualisation* (Alvesson and Sandberg,  
23  
24 2013, Abbott, 2004), is used to suggest an alternative way of thinking about EE's Invisible  
25  
26 College. Following this, the problematising heuristic of *making a reversal* (Alvesson and  
27  
28 Sandberg, 2013; Abbott, 2004), is used to open up new possibilities of interpretation,  
29  
30 specifically in relation to ideas about the hidden systems of ideas which underpin social action  
31  
32 (Midgely, 1992). We conclude by exploring implications for research and practice and offering  
33  
34 questions which arise as a result of considering the practical importance of philosophical  
35  
36 assumptions.  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46

### 47 **Identifying a paradigmatic body of work**

48  
49 Problematisation regards reviews of literature as an exercise in how to “re-think existing  
50  
51 literature in ways that generate new and ‘better’ ways of thinking about specific phenomena”  
52  
53 (Alvesson and Sandberg, 2020, p. 1290). Alvesson and Sandberg explain problematisation is  
54  
55 about “critical scrutiny and insight generation” *not* “vacuum cleaning” literature (Alvesson and  
56  
57 Sandberg, 2020, p. 1298). Thus, problematisation is a very different approach to a systematic  
58  
59  
60

1  
2  
3 or integrative review. The idea is to identify and scrutinise a paradigmatic body of work in a  
4 way which can act as a catalyst for “starting new conversations, not continuing old ones”  
5  
6 (Alvesson and Sandberg, 2020, p. 1291). The approach requires that a review domain should  
7  
8 be constructed or selected in a “thoughtful, creative and critical” way (Alvesson and Sandberg,  
9  
10 2020, p. 1292), and have a stronger focus on “paradigmatic assumptions and ways of  
11  
12 constructing reality” (Alvesson and Sandberg, 2020, p. 1300).  
13  
14

15  
16 A body of work of particular interest in this regard is a set of articles, identified through a co-  
17  
18 citation analysis, said to have revealed EE’s ‘Invisible College’ (Loi et al, 2016). This study  
19  
20 is said to elucidate the ‘theoretical foundations’ and ‘the intellectual structure of the field’ by  
21  
22 studying co-citations recorded in the ISI Web of Science’ (Loi et al, 2016, p. 949) and  
23  
24 revealing ‘EE’s Invisible College’ and a particular ‘school of thought’. This indicates the  
25  
26 requisite paradigmatic quality which is sought in a problematisation exercise, in that this  
27  
28 body of work has already been proposed as having some *deeper* level characteristics rather  
29  
30 than simply sharing a label-focussed surface level characteristics.  
31  
32  
33

34  
35 To further facilitate understanding regarding why this body of work is appealing to explore,  
36  
37 the idea of an Invisible College is considered in the following section.  
38  
39  
40  
41  
42

### 43 **EE’s Invisible College**

44  
45 The term Invisible College is associated with the birth of modern science, when a small group  
46  
47 of scholars met face to face and exchanged ideas on nature, science and philosophy and went  
48  
49 on to become prominent figures in the Royal Society (Lomas, 2009). This sort of frequent  
50  
51 communication between specialists is still said to be a hallmark of modern science (Bakker,  
52  
53 2007), with the exchange of ideas happening through networks of scientific papers (De Solla  
54  
55 Price, 1963) and bibliometric studies traditionally being used as a means to map this scientific  
56  
57 communication (Lievrouw, 1989).  
58  
59  
60

1  
2  
3 *EE's* Invisible College is said to have been revealed by a bibliometric study, where a co-citation  
4  
5 analysis was conducted on literature spanning the period 1991 – 2014 to identify the most  
6  
7 influential and connected articles in the field (Loi *et al.*, 2016). The co-citation approach is said  
8  
9 to “map a specific domain’s collective cognitive patterns over a particular period of time” (Loi  
10  
11 *et al.*, 2016, p. 950), thus whilst many of the articles revealed by Loi *et al.* are not new, they are  
12  
13 influential and oft-cited. Indeed, data collected on the continued citation of these papers (see  
14  
15 Appendix A), shows that *every* article has been cited in the current year, and all papers have  
16  
17 been cited (between dozens and *thousands* of times), since the Loi *et al.* paper was published,  
18  
19 demonstrating the ongoing scholarly influence of articles (and assumptions) in this body of  
20  
21 work. The practical relevance of texts included in *EE's* Invisible College can also be seen in  
22  
23 current policy, for example, Peterman and Kennedy (2003), Athayde (2009) and Oosterbeek *et*  
24  
25 *al.* (2010), are used to justify *EE* recommendations that guide present day practice (Hanson,  
26  
27 Hooley and Cox, 2017), and are included in research reviews that aim to influence policy  
28  
29 (Hughes *et al.*, 2016).  
30  
31  
32  
33

34  
35 In a co-citation analysis, connections *between* articles are investigated - the stronger the  
36  
37 relationship between two pieces of work, the more likely they are related to a particular *school*  
38  
39 *of thought* (Loi *et al.*, 2016). This approach is a means of “unfolding the theoretical core” of a  
40  
41 field, “thereby revealing an invisible college among the associated articles and topics” (Loi *et*  
42  
43 *al.*, 2016, p. 950). That the articles identified by Loi *et al.* are said to represent *EE's* Invisible  
44  
45 College - its intellectual structure and the *theoretical foundations* of the field – prompts the  
46  
47 question: what can we learn about *philosophical assumptions* by reconsidering this body of  
48  
49 work from a deeper - philosophical - perspective? Just as Loi *et al.* were able to say something  
50  
51 about the theoretical core of the literature, this pre-defined and paradigmatic literature offers  
52  
53 an interesting target for problematisation of philosophical assumptions.  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 We find this an interesting and useful process to pursue, because, in our own learning, it has  
4  
5 been through grappling with ideas which work at a deeper, philosophical level - such as critical  
6  
7 (Bhaskar, 1974), and scientific (Pawson, 2006), realism and philosophy in educational research  
8  
9 (Biesta, 2007), and entrepreneuring and becoming in entrepreneurial learning (Johannisson,  
10  
11 2011; Steyart, 2007) - that a fuller appreciation of the influence of assumptions in research  
12  
13 products has been developed. Thus, surfacing and questioning assumptions in EE's Invisible  
14  
15 College may be useful for researchers in our EE community of practice, prompting thinking  
16  
17 about the practical implications of seemingly abstract philosophical considerations. To execute  
18  
19 this approach, the utilisation of three heuristic tools of problematisation - identifying  
20  
21 paradigmatic assumptions, (re)conceptualizing subject matter and making a reversal – is  
22  
23 articulated in the following sections to provoke thinking and generate new questions.  
24  
25  
26  
27  
28  
29  
30

### 31 **Identifying Paradigmatic Assumptions**

32  
33 A purpose of problematisation is to “transform what are commonly seen as truths or facts into  
34  
35 assumptions” (Alvesson and Sandberg, 2013, p. 59). The assumptions this article aims to  
36  
37 unsettle are not related to the content or the constructs of research, but rather ‘the very pre-  
38  
39 suppositions’ that are made when researchers develop and present theory (Alvesson and  
40  
41 Sandberg, 2013, p. 52). These types of assumptions are called paradigmatic assumptions, that  
42  
43 is, they embody some sort of paradigm or say something about particular ‘world views’  
44  
45 regarding the nature of reality, society and knowledge (Alvesson and Sandberg, 2013, p. 59).  
46  
47  
48  
49

50  
51 Previously, methodological approaches in EE have been the focus of review, for example,  
52  
53 exploring methods, types of study, data collection and analysis techniques (Blenker *et al.*,  
54  
55 2014). In addition, an axiological lens has been used to explore values in EE, for examples, by  
56  
57 contrasting profit driven values and their consequences, with values which include social,  
58  
59 environmental and well- being (Refai *et al.*, 2018). But there are calls for more exploration of  
60

1  
2  
3 ontological, epistemological and sociological assumptions (Fayolle *et al.*, 2016). Exploring  
4 such assumptions offers the opportunity to undertake a 'broader and more fundamental' form  
5 of problematisation (Alvesson and Sandberg, 2013, p. 55), which may surface the philosophical  
6 underpinnings of literature and enable the pre-suppositions of research products to be better  
7 understood, and therefore, critiqued. If underpinning assumptions are left unexplored, the  
8 opportunity to consider 'alternative world views' (Alvesson and Sandberg, 2013, p. 59), is  
9 missed, whereas, considering this deeper level can help open up material and make the implicit  
10 or hidden explicit and laid open to scrutiny. But how does one go about doing this? Particularly  
11 when, as Cunliffe (2011), observes many research products do not declare such assumptions.  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22

23  
24 First, a number of *meta-theoretical* stances which describe underlying ontological,  
25 epistemological and sociological assumptions were used to support the process of discerning  
26 and interpreting cues in the articles (Table I). These meta-theoretical stances were combined  
27 to provide an a-priori conceptual framework (Bingham, 2021), from which articles could be  
28 considered and compared.  
29  
30  
31  
32  
33  
34

35  
36 \*\*\*\*\*Insert Table I – Meta-theories used to surface philosophical assumptions - around  
37 here\*\*\*\*\*  
38  
39  
40  
41

42 These meta-theoretical stances elaborate fundamental differences in the world views which  
43 research products can embody, from an ontological perspective (assumptions about the nature  
44 of reality), an epistemological perspective (assumptions about the nature of knowledge) and  
45 sociological perspective (assumptions about the nature of society). More binary (and easier to  
46 grasp) frameworks, such as Johnson and Duberley's (2000) continuum regarding the nature of  
47 social reality, were chosen alongside more the more complex and fluid framework provided by  
48 Cunliffe about epistemological assumptions (2011), and the four paradigms described by  
49 Burrell and Morgan (1979), which illuminate sociological assumptions about the nature of  
50 society. Combined, these meta-theoretical stances provide a conceptual platform to support a

56  
57  
58  
59  
60

1  
2  
3 strategy of mild deductive reasoning (Emigh, 1997), where frameworks for thinking are used  
4  
5 to compare and analyse data (the papers contained within EE's 'Invisible College', in this  
6  
7 instance).  
8  
9

10 As summarised in Table I, ontological assumptions (beliefs about the nature of social reality)  
11  
12 can be compared by considering opposing ends of an objectivist/subjectivist continuum where  
13  
14 the objectivist view is that social reality exists independent of human consciousness and  
15  
16 cognitions (Realism) and the subjectivist view is that reality is simply a product of our minds  
17  
18 with no independent status (Nominalism). Epistemological assumptions can be compared by  
19  
20 considering a continuum which includes subjective, objective and inter-subjective 'knowledge  
21  
22 problematics.' Sociological assumptions can be compared in terms of considering the different  
23  
24 orientations of research: functionalism, interpretative, radical humanism and radical  
25  
26 structuralism. Finally, as many research products are not explicit about these deeper,  
27  
28 philosophical assumptions, the deployment of language in how research accounts are  
29  
30 constructed, methodological choices and the crafting of research is recognised as crucial in  
31  
32 comparing differences between assumptions (Cunliffe, 2011).  
33  
34  
35  
36  
37  
38

39 In practice, comparing paradigmatic assumptions was an interpretative process of moving  
40  
41 between, and re-interpreting, different cues within a piece of work (Alvesson and Sandberg,  
42  
43 2013, p. 59), in relation to the meta-theoretical stances being used to open up material.  
44  
45

46 This process involved: the first author collecting every article, reading and re-reading the texts  
47  
48 in full and using the metatheoretical stances presented in Table I as prompts and signposts to  
49  
50 compare philosophical assumptions. Whilst some articles were read only once and assumptions  
51  
52 appeared more straightforward to interpret, for example quantitative studies where a "pre-test  
53  
54 post-test control group research design" was used to measure effects of an EE programme  
55  
56 (Peterman and Kennedy, 2003). Other articles, or specific sections or lines within such articles,  
57  
58  
59  
60

1  
2  
3 were read repeatedly (for example Rae, 2006, which is discussed in more detail later), with  
4  
5 conclusions less straightforward to infer because of the nuance in the research product and the  
6  
7 different potential philosophical interpretations. As Cunliffe (2011), predicted, most works *did*  
8  
9 *not* explicitly discuss or address ontological and epistemological assumptions, but rather,  
10  
11 assumptions were interpreted from reviewing how “choice of method and language” embodied  
12  
13 particular ontological and epistemological assumptions (Cunliffe, 2011, p. 659). Instead,  
14  
15 elements of the research products - such as the research approach, a summary of the article and  
16  
17 the type of language used - were extracted and used to build a matrix summarising  
18  
19 interpretations about the philosophical assumptions implicit within the body of work. This  
20  
21 matrix is offered at Appendix A and provides an overview of extracted material and  
22  
23 philosophical assumptions interpreted using this approach. Within this interpretative process,  
24  
25 it is important to acknowledge the ‘constructed nature of empirical material’ where, in the  
26  
27 interplay of meta theory and empirical material, a researcher uses the latter as ‘a source of  
28  
29 inspiration for critical dialogue,’ rather than unambiguously screening out one idea from  
30  
31 another (Alvesson and Sandberg, 2013, p. 119). In addition, whilst the first author constructed  
32  
33 the matrix and initial ideas about its implications, it was the act of taking this material and co-  
34  
35 producing a conference paper with the co-author which provided the vehicle for argumentation  
36  
37 about what the elements captured in the matrix might mean. In this process, *written sentences*  
38  
39 – described as visible ‘vehicles of thought’ (Menary, 2007) – could be shared, edited, deleted  
40  
41 and developed. In this case, through 15 versions of the first conference paper, 9 versions of the  
42  
43 second paper and three paper revisions (involving several new paper iterations) in the process  
44  
45 of preparing for publication. As the authors, like many academic writers, are not geographically  
46  
47 co-located, it was through the act of making thoughts and ideas visible in word documents -  
48  
49 which could be commented on, edited, deleted and developed - that insights were shared,  
50  
51 agreed and developed into what is presented in this paper.  
52  
53  
54

### 18 19 **Findings – Assumptions in EE’s Invisible College**

20  
21  
22 EE’s Invisible College was described by Loi *et al.* (2016), in terms of its ‘polycentric’  
23  
24 theoretical foundations, that is: five core themes revolving around introspection,  
25  
26 entrepreneurial intentions, pedagogy, entrepreneurial learning and evaluation (Loi *et al.*, 2016,  
27  
28 p. 962). However, to repeat, the ultimate interest lies *not* in the content and results of research,  
29  
30 but in how making the very *pre-suppositions* (Alvesson and Sandberg, 2013) of research  
31  
32 problematic, new thinking may be opened up and new conversations started. Therefore, the  
33  
34 purpose of problematisation is not to find an answer to the question ‘What are the philosophical  
35  
36 foundations of EE’s Invisible College?’ but rather to ask ‘What critical insight can we gain  
37  
38 from exploring philosophical assumptions in EE’s Invisible College?’  
39  
40  
41

42  
43  
44 Whilst there is some diversity in methodology within the 44 articles – quantitative, qualitative,  
45  
46 conceptual, empirical – the more *paradigmatic* assumptions are surprisingly similar and  
47  
48 summarised in Table III. In terms of ontological assumptions (assumptions about the nature of  
49  
50 reality), in EE’s Invisible College, the use of scientific language and approach signpost an  
51  
52 assumption that the social world can be treated as the natural world. Experimental approaches,  
53  
54 systematic reviews and meta-analyses suggest that EE is a treatment which can be given to  
55  
56 subjects and its effects accurately measured.  
57  
58  
59  
60

1  
2  
3 Quantitative studies impress upon the reader how the use of control groups and the careful  
4 analysis of data will mean that results are unbiased and robust. This ethos dominates EE's  
5 Invisible College: experiments and quasi-experiments test hypotheses; predictions are  
6 proposed; characteristics are measured; control groups ensure validity; effects are calculated  
7 and analysis is undertaken in systematic and rigorous ways. Such language speaks to the idea  
8 that the social world is 'hard, real and external to the individual' (Burrell and Morgan, 1979,  
9 p. 2).

10  
11 In terms of epistemological assumptions, about the nature of knowledge, research products in  
12 EE's Invisible College are inclined towards embodying objective epistemological assumptions,  
13 where knowledge is something pre-existing that can be extracted, through testing and deducing,  
14 as in the natural sciences. The articles are characterised through the pursuit of models, methods  
15 and measures and an assumption towards theory testing through a structured process of  
16 deductive methods with a view to establishing generalisable findings. Research products  
17 portray a stance where the researcher is an "independent observer, theorizer and predictor of  
18 behaviour", *absent in the text* (Cunliffe, 2011, p. 660), and research accounts are abstract and  
19 academic, often dealing with humans as objects (students, pupils, nascent entrepreneurs,  
20 graduates). The majority of articles imply that knowledge can be objectively accessed, and the  
21 default research posture is that personified by Merton (1938), when he characterised an ethos  
22 of science involving disinterested and sceptical scientific researchers searching for universal  
23 truths.

24  
25 \*\*\*\*\*Insert Table III - Summary of philosophical assumptions – around here.\*\*\*\*\*

26  
27 In comparing the articles, it was possible to find a small number of research products which  
28 offered some variation on this approach. Cope's (2003), qualitative study of the 'lived  
29  
30

1  
2  
3 experience' of six practicing entrepreneurs, acknowledges the active role of the researcher in  
4  
5 *co-constructing* knowledge and meaning. Cope (2011), also offers another alternative to natural  
6  
7 science, with an interpretative phenomenological analysis involving 8 entrepreneurs reflecting  
8  
9 on failure and illustrating how tightly bound the experience and understanding of the  
10  
11 entrepreneurs was with the people around them (relatives, employees, spouses), and the pivotal  
12  
13 role of the researcher in drawing out this experience. Such accounts illuminate the living  
14  
15 conversations between researcher and the researched, and how relationships between people  
16  
17 provide insights into how we relate to each other. Rae (2006), too offers an alternative  
18  
19 approach, and out of the 44 articles, commits the most space to discussing assumptions  
20  
21 underpinning the research. Rae uses a 'social constructionist methodology, making use of  
22  
23 narrative and discourse analysis' and argues that this 'alternative and equally valid perspective  
24  
25 to the entitative ontology' (Rae, 2006, p. 39). In exploring the 'lifeworld' of the entrepreneur  
26  
27 Rae considers that: 'the 'voice of the entrepreneur, together with the interpretation of the  
28  
29 researcher, are vital aspects of understanding the entrepreneurial experience' (Rae, 2006, p.  
30  
31 42). Like Cope, Rae, acknowledges the active role of the researcher as a crucial element in the  
32  
33 co-construction of knowledge. They both create names and personas for the people in their  
34  
35 studies and this position distinguishes their work from most other articles, though, Ravasi and  
36  
37 Turati (2005), also humanise the participants in their comparative case study. It is interesting  
38  
39 to note that the papers with more interpretative leanings, are about *entrepreneurial learning*  
40  
41 rather than entrepreneurship education, making them outliers in EE's Invisible College.  
42  
43 Remove them and the body of work becomes more philosophically consistent. Returning to  
44  
45 this larger body of work, when considering the sociological assumptions that the underlying  
46  
47 ontologies and epistemologies point to, EE's Invisible College is largely functionalist, where  
48  
49 scientific method is used to quantify and analyse the existing social order but *does not* attempt  
50  
51 to change it. This is the sociology of regulation, which presumes a status quo and considers  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 human needs within the context of these existing social systems (Burrell and Morgan, 1979).

4  
5 An alternative to this functionalist inclination is the sociology of radical change, where the  
6  
7 system is not seen as satisfying needs, but as eroding possibilities for human fulfilment. It is  
8  
9 concerned with conflict, change, contradiction and emancipation, ultimately, it is concerned  
10  
11 with potentiality, not actuality – it seeks alternatives to the status quo. Whilst one paper  
12  
13 explored social enterprise (Tracey and Phillips, 2007), a potentially radical subject matter, the  
14  
15 research product is illustrative and analytical, as opposed to radical in the sense that it dealt  
16  
17 with issues of power and domination. It has been noted that the appearance of seemingly  
18  
19 unconventional voices can reproduce the status quo (Alvesson and Sandberg, 2013), if they  
20  
21 give the appearance of progress whilst under the surface and deeper assumptions go  
22  
23 unexamined.  
24  
25  
26  
27  
28

29 It must be said, considering and comparing ontological assumptions in these interpretative  
30  
31 (using participants viewpoints for understanding shared versions of reality), papers is  
32  
33 challenging. In Rae's paper for example, a social constructionist methodological orientation  
34  
35 might influence one towards interpreting that these epistemological assumptions are  
36  
37 incompatible with ontological realism (which assumes mind independent social reality). Here,  
38  
39 the complexities elaborated by Cunliffe (2011), about how ontologies are embodied in research  
40  
41 products through linguistic and methodological choices become important in aiding  
42  
43 comparisons. She explains that meta-theoretical assumptions blur and overlap, and when  
44  
45 considering assumptions in research products the key is not to ask 'are these the right  
46  
47 categories?' or 'who fits in each', but rather, 'which differences make a difference?' (Cunliffe,  
48  
49 2011, p. 20). In the case of Rae's paper, this prompted a delve into the work of social  
50  
51 constructionist Gergen (2001), who discusses that social construction is not just as way of  
52  
53 viewing knowledge construction (between people), but, *ontologically* speaking, asks an  
54  
55 entirely new set of questions relating to political, ideological and ethical aims. In addition, the  
56  
57  
58  
59  
60

1  
2  
3 work of Elder-Vass (2012), about realist social construction, was important in considering how  
4 social construction and realism are compatible. Thus, when comparing ontological  
5 social construction and realism are compatible. Thus, when comparing ontological  
6 assumptions, one is searching for signposts about the deep concerns and assumptions, *not just*  
7 about how knowledge is constructed.  
8  
9

10  
11 Suffice to say, problematisation is an exercise in interpretation, its goal is to try to surface and  
12 question assumptions embodied in literature. It should be acknowledged that this is a  
13 subjective, sometimes complex activity, for which different authors with different experiences  
14 and a different research process may generate different insights. The process differs from, say,  
15 interviewing authors about the philosophical assumptions they were trying to embody and  
16 presenting unproblematic summaries of their views or intentions. It is important to  
17 acknowledge therefore, that an author might hold a different interpretation about their own  
18 assumptions than what is being articulated here, or indeed a reader of this paper might have a  
19 different view, based on their own interpretations of meta-theories, or particular perspectives  
20 they know, or even elements within that perspective that speak to them. Discussions about  
21 philosophical assumptions can get extremely detailed and nuanced, the purpose here is simply  
22 to *open up* these more paradigmatic assumptions for consideration by members of the EE  
23 research community.  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42

43 Now meta-theoretical assumptions in EE's Invisible College have been compared, and  
44 challenges in relation to this process discussed, further intellectual resources offered by  
45 problematisation - (re)conceptualisation and making a reversal - are used to enable a  
46 reconsideration of this body of work.  
47  
48  
49  
50  
51

### 52 53 **(Re)conceptualisation – from Invisible College to Epistemic Bubble**

54  
55 A central ambition of problematisation is to generate re-conceptualisations of existing thinking  
56 that trigger new ideas and ways of thinking about existing phenomena (Alvesson and Sandberg,  
57  
58  
59  
60

1  
2  
3 2020). The (re)conceptualisation of subject matter is a useful step which can point towards a  
4  
5 direction for further study but without prescribing a fixed outcome (Alvesson and Sandberg,  
6  
7 2013, p. 64). It involves suggesting an alternative way of thinking about a phenomenon which  
8  
9 prompts people to reconsider what *they thought* they knew, for example that college dating is  
10  
11 not about relationships and intimacy but about bragging rights and status (Abbott, 2004, p.  
12  
13 123).  
14  
15

16  
17 The idea that the body of work identified by Loi *et al.* was said to represent EE's *Invisible*  
18  
19 *College* is particularly thought provoking. An invisible college has been characterised as a  
20  
21 scientific in-group (De Solla Price and Beaver, 1966), a social structure of influence and  
22  
23 communication (Crane, 1977), and a global collaborative network and knowledge 'market'  
24  
25 which emerges from the choices of hundreds of individuals seeking to maximize their own  
26  
27 welfare (Wagner, 2009). In an invisible college research results are discussed and colleagues  
28  
29 play a role in constructing an 'international forum' by referring in their own work to earlier  
30  
31 work of other scientists (Van Raan, 2005). In a reconsideration of co-citation analysis,  
32  
33 Lievrouw (1989), points out that co-citations are made *by people*, but co-citation analysis  
34  
35 often focusses on the end product (a map of connections between articles) rather than the  
36  
37 *people and social processes* which might influence citing behaviour. Thus, a  
38  
39 (re)conceptualisation might mean moving from a framing of EE's *Invisible College* as benign  
40  
41 and ingenuous and as unproblematically revealing the traditions and collective logic of the  
42  
43 field towards something more akin to an echo chamber or epistemic bubble, which  
44  
45 encompasses the role of people and social processes. An echo chamber is a term derived from  
46  
47 an acoustic chamber where sound reverberates. This analogy has been developed to describe  
48  
49 the situation where the beliefs of a group of people (in real life or on-line), are strengthened  
50  
51 through repetition (Sunstein, 2001). The impact of echo chambers has become a greater focus  
52  
53 of research, because of their potential to effectively inure participants to the views of  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 outsiders (Sunstein, 2001; Sunstein, 2018). Indeed, a quality of an echo chamber is that ones'  
4 views are amplified and returned, and thus, they have the tendency to increase the strength of  
5 one's *initial* view. An epistemic bubble (Nguyen, 2018), is a passive structure of omission  
6 where a group doesn't have contact with other views and isn't exposed to alternative  
7 arguments. A distinction between these two concepts is the relationship between insiders and  
8 outsiders. In an echo chamber insiders are systematically brought to distrust outsiders and  
9 there is an active structure of exclusion through discrediting; in an epistemic bubble the group  
10 is caught in a poor information flow which filters out information and narrows focus along  
11 institutional lines (Nguyen, 2018). Whether the philosophical assumptions discernible in EE's  
12 Invisible College are more akin to an echo chamber or an epistemic bubble is a topic for  
13 further exploration beyond the scope of this paper, but the spirit of either alternative analogy  
14 is simply to draw attention to the idea that sameness can be re-conceptualised as active or  
15 passive exclusion or omission by people and social processes, rather than esteemed tradition  
16 and collective logic found in articles. This dynamic is implicit in the sub-title of the paper  
17 which was the inspiration for this problematisation: 'The theoretical foundations of  
18 entrepreneurship education: *How co-citations are shaping the field*' (Loi et al, 2016, p. 948,  
19 emphasis added), which may prompt us to think through, as Lievrouw (1989), suggests we  
20 should, that scientific development is made *by people*, who are influenced by the behaviour  
21 of others to the extent that certain assumptions become seen as natural and alternative world  
22 views may be either actively or passively omitted. Having (re)conceptualised EE's Invisible  
23 College, in the following section, the 'making a reversal' heuristic is deployed.

### 51 **Making a reversal – the philosophical homogeneity of heterogenous research**

52 Making a reversal involves taking an opposite view of something that is perceived as  
53 established fact, for example, claiming 'terrorism is good' because it unites people against  
54 external threats and leads to extra funding sought by the military and police (Alvesson and  
55  
56  
57  
58  
59  
60

1  
2  
3 Sandberg, 2013, p. 64). This ‘reversal heuristic’ (Abbott, 2004), is intended to open up new  
4  
5 zones of investigation and possibilities of interpretation.  
6  
7

8 EE research has been described as highly fragmented because it lacks the strong theoretical  
9  
10 trends and cumulative knowledge (Fayolle, 2013), and is fragmented conceptually and  
11  
12 methodologically (Blenker *et al.*, 2014). At the *surface* level of EE programmes and courses,  
13  
14 there are numerous definitions, different objectives and purposes, different audiences from  
15  
16 school children to practicing entrepreneurs, different content and teaching methods, different  
17  
18 approaches to assess and evaluate. Whilst EE research might appear heterogenous at this  
19  
20 surface level, diversity is less apparent when considering the philosophical assumptions  
21  
22 underpinning EE’s most co-cited literature. Indeed, at a *deeper*, philosophical level, the body  
23  
24 of work studied was remarkably similar. With some notable expectations, EE’s Invisible  
25  
26 College is a place where ideas about an external social reality accessible to the dispassionate  
27  
28 researcher are accepted, where assumptions about the possibility of objective knowledge and  
29  
30 the superiority of scientific methodology dominate and where functionalist research products  
31  
32 reproduce the social status quo. At a deep level, EE’s Invisible College is, philosophically  
33  
34 speaking, rather more homogeneous than heterogeneous.  
35  
36  
37  
38  
39  
40

41 Does this particular case of homogeneity matter? Does it matter if the social world is treated  
42  
43 as the natural world and objective knowledge assumed as possible? Aren’t these the values of  
44  
45 high science to which the most esteemed literature in the field should aspire in order to be  
46  
47 rigorous? To consider these questions, we put this pattern of objective paradigmatic  
48  
49 assumptions ‘into conversation’ (Alvesson and Sandberg, 2013), with theorising which  
50  
51 recognises the practical significance ‘hidden systems of ideas’ have on social action (Midgely,  
52  
53  
54  
55 1992).  
56  
57  
58  
59  
60

1  
2  
3 In a metaphor which aims to articulate its highly practical nature, philosophy was likened to  
4 plumbing by the philosopher Mary Midgely (1992): “Plumbing and philosophy are both  
5 activities that arise because elaborate cultures like ours have, beneath their surface, a fairly  
6 complex system which is usually unnoticed, but which sometimes goes wrong. In both cases,  
7 this can have serious consequences.” (Midgely, 1992, p. 139).  
8  
9  
10  
11  
12  
13  
14

15 Midgely described that when *the ideas* we live by function badly ‘they do not usually drip  
16 through the ceiling audibly and swamp the kitchen floor’ but are more like a *bad smell* or a  
17 *sense of cold* that creeps in gradually which will ‘quietly distort and obstruct our thinking’  
18 (Midgely, 1992, p. 139). Midgely observed that ‘We may indeed complain that life is going  
19 badly...’ but that it can be hard to see why as it is ‘notoriously difficult’ to turn attention to  
20 what might be wrong with our ideas, and the very structure of our thought: ‘Attention naturally  
21 flows outwards to what is wrong in the world around us’ whereas, what is needed to ‘bend  
22 thought round so that it looks critically at itself’ (Midgely, 1992, p. 140).

34 We do not need to go too far in EE to hear colleagues articulating some cold creeping in.  
35 Concerns being expressed range from a lack of legitimacy and a lack of criticality in research  
36 to a taken-for-grantedness, and an exclusionary, environmentally and socially unsustainable  
37 potential in practice (Fayolle, 2013; Fayolle et al, 2016; Berglund and Verduijn, 2018, Hytti,  
38 2018, Loi *et al.*, 2021). If these are the troubles and complaints observed at the surface level,  
39 Midgely would ask us to think about the ‘hidden system of ideas’ which underlies what we can  
40 see, that is: what problems there might be with the ‘philosophical plumbing.’ The objective,  
41 functionalist assumptions which underpins EE’s Invisible College is such a hidden system of  
42 ideas. Thus, in the next section, we consider this particular case of philosophical plumbing and  
43 its implications.

### Implications for research and research practice

Just as it has been argued that pedagogical practice is adopted more or less unconsciously by teachers, limiting what practice is possible (Fayolle et al, 2016), this logic also stands for how research is enacted and the assumptions that are seen as natural. Patterns underlying our thought are 'more powerful, more intricate and more dangerous than we usually notice' and need constant attention, for they have a strong grasp on our imagination (Midgely, 1992, p. 146). So, what are the implications of the homogenous objective and functionalist philosophical plumbing in EE's Invisible College? What's the problem with the idea that there is one, hard, external reality, accessible to a dispassionate researcher?

First, this rational and objective world view has been dismantled by different theoretical frameworks which signpost the importance of cultural, historical and social context, to the extent that it has been argued that findings (even those from natural science) are themselves social constructions and human interpretations (La Tour and Woolgar, 1979; Crotty, 1998; Johnson and Duberley, 1998; Fielding, 2009).

In addition, scientific approaches, philosophically focussed as they are on the measurable have been said to encourage under-theorization and emaciated explanation (Fleetwood, 2007). This can be seen in EE evaluation studies, such as a meta-analysis, where a statistical relationship is found between entrepreneurship education and training and the development of human capital, but authors say so little is known about the courses, course content or teaching methods that it is not possible to provide insight into what influences outcomes to happen (Martin *et al.*, 2013, p. 222). What is more, measurement focussed impact studies acknowledge that it is difficult to control for initial and unobservable differences between students (Peterman and Kennedy, 2003; Oosterbeek *et al.*, 2010), and that self-selection bias is an issue (Athayde, 2009).

1  
2  
3 Such differences between students and their social circumstances are exactly the kind of  
4 contextual issues that might help researchers better *explain* EE and its effects for individuals  
5 and society, with appeals for the study of context appearing in research conference calls  
6 (RENT, 2021; 3e 2022). For, whilst empirical science focused only on the observable and  
7 measurable see context as a limitation, something to be minimised and statistically controlled,  
8 ontologically deep philosophies (Bhaskar, 1974; Pawson, 2013; Jagosh, 2019), see context as  
9 something which can be explored and learned from, used to open up what we know.

10  
11  
12 Furthermore, EE practice has been acknowledged as highly dynamic, where one is trying to  
13 understand the interplay of multiple social interactions, navigate complex environments, and  
14 revise strategies about how to turn ideas into action (Fayolle and Toutain, 2013). The relational  
15 and temporal elements of EE are crucial (Jones and Matlay, 2011), where learning and  
16 development is created *in events* and *between people* (Van de Ven, 2007). This social  
17 environment in which EE exists is one which holds rich, in-depth knowledge requiring  
18 researchers to adopt divergent ontological and epistemological positions and modes of inquiry  
19 which embrace the complexity of human practice (Easterby-Smith *et al.*, 2008; Gephart, 2004).

20  
21  
22 A final point: scientific truth claims are constructed around the idea that research holds a mirror  
23 up to a single, external reality (Rorty, 1979). But, given the functionalist inclinations of EE's  
24 Invisible College, what if the picture it reflects is a reality that many won't recognise? A picture  
25 where power, inequality and disadvantage - as illustrated by such authors as Foucault (1980),  
26 Habermas (1987) and Bourdieu (1989), and in relation to entrepreneurship (Blackburn and  
27 Ram, 2007; Martinez Dy, 2020) and entrepreneurship education itself (Brentnall *et al.*, 2018)  
28 - are rendered invisible. EE's legitimacy could be strengthened by more ethical and conscious  
29 (Fayolle *et al.*, 2016), and critical (Berglund and Verduijn, 2018), research, and a willingness  
30 to explore EE's dark side (Bandera *et al.*, 2020). New methods and out of the box thinking is  
31

54  
55  
56  
57  
58  
59  
60

1  
2  
3 needed to illuminate what is happening in EE practice (Fayolle, 2019), and to work ‘with’  
4  
5 context to support research development (Thomassen *et al.*, 2019).  
6  
7

8 As identified by Fayolle *et al.* (2016), it is through *sociological* works, that we explore how  
9  
10 the normalisation of autonomy makes individuals more vulnerable, how important solidarity  
11  
12 and cooperation are and about the stress induced consequences of excessive economic  
13  
14 competition (Fayolle *et al.*, 2016). Sociological studies have a pre-occupation for the role,  
15  
16 function and impact of education for society (Béchar and Grégoire, 2005), and are thus crucial  
17  
18 in understanding of the impact of EE on its ultimate client (society), which is necessary to  
19  
20 strengthen the field’s legitimacy (Fayolle, 2013). Thus, specifically adopting under-represented  
21  
22 sociological paradigms may generate both new knowledge, as well as an alternative research  
23  
24 stance which aims to interrupt ideological constraints and catalyse social change (Burrell and  
25  
26 Morgan, 1979).  
27  
28  
29  
30  
31

32 Such research goals align with ambitions for more inclusive, transformational, environmentally  
33  
34 and socially sustainable EE (Hytti, 2018; Ratten and Jones, 2018; Neergard *et al.*, 2020; Loi *et*  
35  
36 *al.*, 2021), indeed, it is difficult to envision how changes at the surface level, the practice level,  
37  
38 are likely or possible without attending to the assumptions which underpin them in research.  
39  
40 Without paying attention to the philosophical plumbing (Midgely, 1992), is it more likely to  
41  
42 imagine a situation where we continue to notice the creeping cold, but we do not attend to the  
43  
44 hidden system of ideas that keeps things the way they are. These issues demonstrate, as  
45  
46 Midgely argued, that philosophy is not just grand and abstract, but practical and with serious  
47  
48 consequences, particularly in the construction of knowledge, which is highly valued in society  
49  
50 and where inherited values, ideas and conceptual schemes *seep in* to everyday thinking and  
51  
52 common sense (Midgely, 1992).  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 We reflect that this dynamic – inherited values and ideas seeping into everyday thinking – can  
4  
5 be identified in the process of developing this paper. Consider for a moment the research matrix  
6  
7 presented in the Appendix and which provided the stimulus for the shared problematisation. It  
8  
9 offers a lesson in how philosophies are unconsciously inherited and enacted. The initial  
10  
11 collation and review of the articles was underpinned by a deep belief about what is acceptable  
12  
13 research in EE. First, a lurking assumption about the superiority of quantifying a phenomenon  
14  
15 may be discerned from choosing an approach to *count* philosophies. Second, the construction  
16  
17 of a table, the selection and (re)presentation of certain information contributes to the  
18  
19 *appearance* of systematisation, but in fact, it was a human, with all their personal inclinations  
20  
21 and cognitive filters, who constructed it. Finally, concern regarding the likelihood of research  
22  
23 being accepted at a conference or for publication, means that the expectations and style of ones'  
24  
25 academic community and professional circumstances are omnipresent in the scholarly process.  
26  
27 Not straying too far from inherited traditions and styles is considered pragmatically and in  
28  
29 relation to professional and personal risk and opportunity.  
30  
31  
32  
33  
34  
35  
36  
37

38  
39 Despite, or perhaps *because* of these tensions, and because the ultimate goal of  
40  
41 problematisation is to construct new avenues for thinking and action (Alvesson and Sandberg,  
42  
43 2013), we conclude by posing three questions in relation to the implications of assumptions  
44  
45 which underpin research practice. First, in relation to *the type of research* that is pursued and  
46  
47 legitimised in the field of EE, we ask: how can alternative modes of inquiry be nurtured which  
48  
49 exemplify diverse ways of doing research and better capture and reflect the complexity of EE  
50  
51 practice? Connected to this, and in relation to *the socialisation of researchers* in the field, we  
52  
53 ask: how could intentionally prioritising overlooked sociological issues prompt scholars to  
54  
55 pursue research which might change the status quo, instead of analysing it? Finally, in relation  
56  
57 to *the strengthening of criticality*, we ask: how can adopting alternative, ontologically deep  
58  
59  
60

1  
2  
3 philosophies open up, challenge and transform what we think we know about EE and its wider  
4  
5 impact? Such questions illustrate that, far from philosophical assumptions being an abstract or  
6  
7 unimportant concern, they have the power to constrain or empower social action and the impact  
8  
9 of research.

### 11 **Conclusion**

12  
13  
14 The aim of this paper has been to energise discussion around the importance of philosophical  
15  
16 assumptions in EE research and unsettle thinking about what assumptions appear normal and  
17  
18 natural in research products. A paradigmatic body of work - EE's Invisible College - was the  
19  
20 target for problematisation, because of its connected and influential quality, and articles being  
21  
22 frequently cited together and still referenced today. These historically important and currently  
23  
24 relevant articles were previously studied from a theoretical viewpoint, but this paper undertook  
25  
26 to explore the body of work from a philosophical perspective. Pursuing this task from a  
27  
28 problematising mode of inquiry offered the opportunity to think critically about the importance  
29  
30 of philosophical assumptions, the patterns of assumptions that are inherited and the  
31  
32 implications of these assumptions, particularly in relation to ambitions for EE to be more  
33  
34 socially impactful. In developing this argument, EE's Invisible College was reconceptualised  
35  
36 from a benign and ingenuous collective logic to an echo chamber or epistemic bubble to draw  
37  
38 attention to the role of people and social processes in the co-citations and the construction of  
39  
40 knowledge. In addition, the notion of fragmentation and heterogeneity in EE was reversed by  
41  
42 drawing attention to the homogenous – objective and functionalist - philosophical assumptions  
43  
44 in the majority of the research products compared. Within considering the implications of these  
45  
46 assumptions, a connection was made between problems that are observed at surface level -  
47  
48 from lack of legitimacy, criticality and the exclusionary, socially and environmentally  
49  
50 problematic potential of EE - to the *hidden system of ideas* which lies beneath.

1  
2  
3 Having highlighted the potential problems of the deeper assumptions, questions were posed,  
4  
5 and practical implications identified, in relation to pursuing alternative modes of inquiry,  
6  
7 prompting interest in overlooked sociological issues and purposefully adopting ontologically  
8  
9 deep philosophies open up, challenge and transform what we think we know about EE and its  
10  
11 wider impact.  
12  
13

14  
15 By putting philosophical assumptions into conversation with theorising which appreciates the  
16  
17 *practical* importance of philosophy, new thinking is opened up regarding the significance of  
18  
19 the ideas that seep into and influence everyday thinking and action. Midgely reminds us that  
20  
21 when things go wrong at the surface we must dig into the ‘the assumptions that we have  
22  
23 inherited and have been brought up with’ and ‘we must restate those existing assumptions...so  
24  
25 as the get our fingers on the source of the trouble’ (Midgely, 1992, p. 140). This paper is a  
26  
27 contribution to thinking through existing assumptions by paying attention to the philosophical  
28  
29 plumbing that might, in EE, help reveal a source of the creeping cold noticed by authors who  
30  
31 write about legitimacy and criticality, the taken-for-grantedness of the field and the necessity  
32  
33 to ensure its positive social usefulness.

| Assumption   | Key elements of meta-theoretical stance used to (re)consider philosophical assumptions  | Language   |
|--|---|--|
| Ontological assumptions about nature of social reality (Johnson and Duberley, 2000). | Ontological assumptions (beliefs about the nature of social reality) are presented as on opposing ends of an objectivist/subjectivist continuum where the objectivist view is that social reality exists independent of human consciousness and cognitions ( <b>Realism</b> ) and the subjectivist view is that reality is simply a product of our minds with no independent status ( <b>Nominalism</b> ).  |  |
| Epistemological assumptions about the nature of knowledge (Cunliffe, 2011).          | Epistemological assumptions are presented as being on a fluid and dynamic continuum which includes subjective, objective and inter-subjective 'knowledge problematics' (as opposed to neat categories).<br><b>Subjectivism</b> – Common sense knowledge – naturally occurring actions, interactions, conversations. Non-replicable knowledge, situated validity. Macro and micro level focus. Researcher embedded in the world, shaped by (and shapes) experiences and accounts, mediates meanings of actors. Experience in the world. Researcher as outsider or insider.<br><b>Objectivism</b> – Replicable or shareable knowledge leading to the accumulation of knowledge. Knowledge and researcher are separate from the world. Researcher observes, discovers facts and develops predictive theories. Often Macro level focus.<br><b>Intersubjectivism</b> – In-situ, knowing-from-within. Transitory understandings and 'witness' thinking. Micro level focus. Research as embedded and embodied, as a dialectical interplay between research participants. Focusses on experiences between people. Embodied and embedded researcher. | What assumptions are indicated by the deployment of language?<br><br>How does the language that authors use to construct their research accounts reveal certain ontological and epistemological assumptions? |
| Sociological assumptions about the nature of society (Burrell and Morgan, 1979).     | Four paradigms describe different orientations towards research:<br><b>Functionalism</b> - aim is to use scientific method to analyse society and its institutions and contribute to an ordered status quo.<br><b>Interpretative</b> – aim is to use participants viewpoints used to understand shared versions of reality.<br><b>Radical Humanism</b> – aim is to release people from socially constructed realities and ideological constraints by developing alternatives.<br><b>Radical Structuralism</b> – aim is to analyse dominating and exploitative organisations and processes.  | (Cunliffe, 2011, pp. 659 – 665).   |

Table I – Meta-theories used to surface philosophical assumptions

| Author (year of publication). | Last citation/cites since 2017. | Research approach | Summary of article  | Signposting Language  | Ontological assumption | Knowledge Problematic | Paradigm       |
|-------------------------------|---------------------------------|-------------------|---|---|------------------------|-----------------------|----------------|
| Kreuger <i>et al</i> (2000)   | Last cited 2021. / 3530.        | Quantitative      | A 'competing models approach' is utilised to compare two intentions based models using regression analysis on data from a sample of student subjects. | Predict<br>Robust<br>Generalizable<br>Validity<br>Testable<br>Model                       | Realism                | Objective             | Functionalism  |
| Katz (2003)                   | Last cited 2021 / 678           | Qualitative       | A detailed chronology of entrepreneurship education in the United States.   | Review<br>Historical<br>Primary Sources<br>Secondary Sources<br>Interviews                | Realism                | Objective             | Functionalism  |
| Peterman and Kennedy (2003)   | Last cited 2021 / 1140          | Quantitative      | Pre-test/post test control group design to test the effects of a Young Achievement programme on 117 students.   | Effect<br>Empirical<br>Measure<br>Hypothesis<br>Control Group                             | Realism                | Objective             | Functionalism  |
| Cope (2003)                   | Last cited 2021 / 348           | Qualitative       | Qualitative case study research into the 'lived experience' of six practising entrepreneurs using interviews and story logs.                          | Personal<br>Representation<br>Sense Making<br>Meaning<br>Stories<br>Case                  | Realism                | Intersubjective       | Interpretative |
| Rae (2006)                    | Last cited 2021 / 116           | Qualitative       | The paper explores a qualitative study on how entrepreneurial behaviours are learned and develops a conceptual framework.                             | Social<br>constructionist<br>Discourse<br>Analysis<br>Sense Making<br>Meaning<br>Ontology | Realism                | Intersubjective       | Interpretative |
| Martin <i>et al</i> (2013)    | Last cited 2021 / 1030          | Quantitative      | A meta-analysis of entrepreneurship education literature is conducted to examine outcomes in relation to human capital assets.                        | Quantitative<br>Review<br>Hypothesis<br>Moderator<br>Correlations<br>Calculated           | Realism                | Objective             | Functionalism  |
